

WHAT IS EROSION?

Erosion is the geological process in which Earth materials are transported from one place to other.

When erosion takes place rock and soil are transported as a consequence of the effect of natural forces, mainly wind, ice or water.

There are two types of erosion: physical and chemical erosion. Physical erosion refers to rocks changing their physical properties without changing their basic chemical composition. Chemical erosion causes the breakdown and decay of rocks through a chemical process.

A good example of erosion can be found in The Grand Canyon, in Colorado (United States).

Landscape Evolution Kerry Gallagher, Stuart J. Jones, John Wainwright, 2008 The morphology of Earth's surface reflects the interaction of climate tectonics and denudational processes operating over a wide range of spatial and temporal scales These processes can be considered catastrophic or continuous depending on the timescale of observation or interest Recent research had required integration of historically distinct subjects such as geomorphology sedimentology climatology and tectonics Together these have provided new insights into absolute and relative rates of denudation and the factors that control the many dynamic processes involved Specific subject areas covered are sediment transport processes and the timescales of competing processes the role of the geological record and landscapes in constraining different processes the nature of landscape evolution at different spatial scales and in contrasting geological environments **New Zealand Books in Print**, 1998

Applied Spatial Modelling and Planning John R. Lombard, Eliahu Stern, Graham Clarke, 2016-10-04 This book highlights the extraordinary range of areas to which geographical analysis and spatial modelling can bring lessons and insights It shows how these techniques have been used to address real world issues that are of concern to international organisations public agencies and businesses as illustrated by actual funded projects that geographers have developed collaboratively with end users Applied Spatial Modelling and Planning shows how much geographical research is policy relevant to a wide variety of agencies through the use of GIS and spatial modelling in applied geography The book's chapters contain a cross section of innovative applications and approaches to problem solving within five major domains of the dynamics of economic space housing and settlements population movements and population ageing health care and the environment Using a number of case studies on the use of GIS and spatial modelling this book demonstrates the fact that much of what is done by quantitative geographers is not only relevant within academia but also has use in policy work This book will appeal to an international audience interested in cutting edge spatial modelling to better understand the processes involved in solving real problems
