Research general practices

IN October 1994 the Royal College of General Practitioners appointed its first two research general practices following national advertisement. Drs Jim Cox of Cumbria and Andrew Farmer of Oxfordshire were successful and their practices became research general practices. Their appointments began immediately.

In February 1995 the Research and Development Directorate of the National Health Service Executive (South and West) was the first among the NHS research directorates to follow this up. Ten research general practices were appointed, also after advertisement, but limited this time to the geographical area contained by the South and West Regional Health Authority. The appointments started in April 1995. The RCGP congratulates Professor Stephen Frankel on being the first regional director to respond to this RCGP initiative.

Thus a new organizational animal has appeared in general practice. What are research general practices? Why are they necessary? And what is their significance?

Research in general practice has a long and honourable history dating back to Smellie in the early 18th century, Jenner in the late 18th century, through Budd¹ in the early 19th century, Mackenzie² in the late 19th century, and Pickles³ and Huygen⁴ in the 20th century.

Since the second world war Fry,⁵ Tudor Hart⁶ and Marsh⁷ have been outstanding as general practitioner researchers working from their own practices and publishing much original work in major peer-reviewed journals of international standing. They have shown that the single general practice is still appropriate as a place for research.

One of the first policies of the newly formed College of General Practitioners in 1952 was to start a campaign to get general practitioners into the universities⁸ and this has been increasingly successful — there are now departments of general practice in all medical schools in the United Kingdom, and chairs of general practice in all but two. Between the establishment of the first chair of general practice in the world in Edinburgh in 1963 and the end of the 1980s, emphasis has been placed primarily on the emerging university departments as they themselves and the RCGP have campaigned to build up departments of general practice and get them well established. Meanwhile, however, there were always individual practitioners with a research interest who developed their discipline from the base of ordinary NHS practice. Although many of these practitioners linked up with their university colleagues, some (notably John Fry) did not. Whatever the case, there was no facility to provide any infrastructure support for them.

Infrastructure in this context comprises extra staff, extra or

more powerful computers, additional telephone use, extra stationery and, above all, partners' time to reflect on and discuss research ideas. Such practices tend to attract many more visitors than usual, for example colleagues from all branches of medicine and NHS managers, and carry all the expenses themselves. Those who sometimes criticize the quantity or quality of clinical research in general practice often forget that the doctors concerned have been paying all the infrastructure costs out of their own pockets.

Such issues have never been comparable in specialist medicine. The university funding councils fund a large number of academics but in addition there has also been much infrastructure support provided through the NHS. Many chairs and academic posts in universities, both full and part time, are funded by regional health authorities or district health authorities, or by hospital and community trusts. The chairman of the conference of medical royal colleges and faculties on science and technology has recently estimated that some medical schools have as many as 40% of their staff funded by the NHS.⁹ By contrast family health services authorities/health boards have no equivalent funding to offer general practitioners.

There are also several NHS funds such as the 'service increment for teaching' in England (and equivalent funds in Scotland and Northern Ireland) of which the vast majority go to secondary rather than primary care. Other NHS funds, such as non-service increment for teaching funds, go virtually exclusively to hospitals.

The NHS research system has been hostile to general practice since 1948 and it has always been the RCGP's strategy to work progressively towards a more level playing field.¹⁰ The strategy is twofold: first, to build up in primary care the organizational equivalent of the teaching hospital; secondly, and simultaneously, to open a second NHS funding stream for general practice in addition to the university route through the national funding councils.

The idea of a research general practice first emerged in the peer-reviewed literature in 1991 in a piece summarizing the obstacles to general practice research.¹¹ This call for research general practices is an idea that the RCGP has been nurturing and developing ever since. The RCGP's research plan is to appoint and develop research general practices, while simultaneously seeking to persuade the NHS to develop and fund them, in the same way as training practices, throughout the UK.

Research general practices are defined as ordinary general practices offering at least one practice partner, preferably two, with a real interest in research and a current research capability. These appointments are not training fellowships and are not

Epidemiology And Research In General Practice:

General Practice Under the National Health Service 1948-1997 Irvine Loudon, John Horder, Charles Webster, 1998 This is a history of general practice under the National Health Service covering the whole of the first 50 years from 1948 to the present

Research Methods in Primary Care Yvonne Carter, Cathryn Thomas, 1997 This book is designed to introduce a basic range of research skills relevant to primary care

Primary Health Care and Psychiatric Epidemiology Brian Cooper, Robin Eastwood, 2018-09-24 In the years prior to publication primary health care had been gaining in significance as a setting both for research on mental illness in the general population and for the development of new preventive approaches in this field The growing need for research had received impetus from the escalating costs of hospital based health care the restructuring of health services in a number of countries with an increased emphasis on community care and prevention and the World Health Organization's Health for All campaign in response to which a growing number of national planning documents had been published These developments had already stimulated a new interest in the scope for epidemiological and evaluative investigations based on general medical practice This book originally published in 1992 consists of selected contributions to the first international scientific meeting on this topic held in Toronto in 1989 It is made up of five sections dealing respectively with the growth and development of a new research field findings of psychiatric surveys in general practice in a number of different countries specialist and generalist medical care for mental illness issues of selection and referral and specialist aspects of late life mental disorders encountered in such research The inclusion of reports from groups of workers in the USA the UK the Netherlands Germany Spain Italy Finland Canada Australia and other countries testifies to the rapid spread of interest in these questions With the exception of the first two chapters which sketch the background of public health and general practice epidemiology all the contributions are focused on general practice as a field laboratory for study of the occurrence distribution diagnostic composition and risk factors of psychiatric illness in unselected populations and present data largely unpublished from the authors own projects These findings confirm the importance of research in general practice as a major growing point of social psychiatry and provide guidelines for further progress in the years ahead This book will still be an invaluable source of reference to all psychiatrists psychologists general practitioners and health care professionals concerned with mental disorders in the wider community

Epidemiology in General Practice David Cameron Morrell, 1988 This book describes the many ways in which epidemiological methods may be used to solve problems in family practice Practicing physicians are concerned with understanding the incidence prevalence and natural history of symptoms of disease They are also concerned with the factors which prompt ill individuals to seek medical assistance and which may help prevent healthy individuals from falling ill The interpretation of symptoms and the use of diagnostic skills are likewise governed by knowledge of the probability of disease Epidemiology provides the basis for making these decisions and this book makes the principles and methods of epidemiology accessible to every doctor It identifies many typical problems

Oppenheimer,2022 Psychiatric epidemiology like cancer heart disease or AIDS epidemiology increasingly dominates the bio politics of nations and of worldwide health campaigns like the Global Burden of Disease Yet this is the first book length history of psychiatric epidemiology arguably the oldest of epidemiological disciplines albeit the slowest to develop intellectually and institutionally The epidemiology of mental disorders and mental health differs

radically from that of other diseases and health conditions in that it studies subjective states difficult to objectify or precisely define. Despite these obstacles, over many decades, researchers, governments, and international organizations have continually attempted to measure mental states, their distribution, and presumed causes in the hope of informing public policy, clinical treatment, social reform, and population management. Since the nineteenth century, epidemiology and earlier proto-epidemiology in dissimilar contexts have served strikingly different purposes: from census counts of the insane to imperialist and racist psychological profiles of subaltern groups to attempts to measure diagnostic entities in an entire nation. We argue that these multiple historical paths resulted not in a uniform field based on common paradigms as was the case for cardiovascular and cancer epidemiology, but in a plurality of psychiatric epidemiologies driven by different intellectual questions, reformist ideals, national cultures, and social control objectives.
