LINPACK Users' Guide J. J. Dongarra, J. R. Bunch, C. B. Moler, G. W. Stewart, 1979-01-01 The authors of this carefully structured guide are the principal developers of LINPACK a unique package of Fortran subroutines for analyzing and solving various systems of simultaneous linear algebraic equations and linear least squares problems This guide supports both the casual user of LINPACK who simply requires a library subroutine and the specialist who wishes to modify or extend the code to handle special problems It is also recommended for classroom work

On Round-Off Errors in Linear Programming H. Müller-Merbach, 2012-12-06 Due to the limited number of digits or bits per storage location in electronic computers round off errors arise during arithmetic operations Depending upon the kind of operation the structure of the data and the skillfulness of the program

these errors increase and spread out more or less quickly during a continued computation process in which the computed data affected by errors are themselves used for generating new data The purpose of this investigation was to learn about the increase of round off errors in linear programming procedures Less attention was paid to the theory of round off errors or to the effectiveness of error elimination procedures In regard to these questions the results of investigations which have been made on round off errors in a more general context dealing with matrix inversion and eigenvalue problems could be used for the purposes of this paper The emphasis of this investigation lay rather on studying the behavior of typical linear programming problems from the point of view of error cumulation Error in Digital Computation, Vol.2 L. Yap, 2016-04-16 This book constitutes the thoroughly refereed post conference proceedings of the 6th International Conference on Mathematical Aspects of Computer and Information Sciences MACIS 2015 held in Berlin Germany in November 2015 The 48 revised papers presented together with 7 invited papers were carefully reviewed and selected from numerous submissions The papers are grouped in topical sections on curves and surfaces applied algebraic geometry cryptography verified numerical computation polynomial system solving managing massive data computational theory of differential and difference equations data and knowledge exploration algorithm engineering in geometric computing real complexity theory and practice global optimization and general session *Direction Cosine Computational Error* John W. Jordan, 1969 Strapdown inertial systems possess a potential advantage over more conventional inertial systems since they do not require a mechanical gimbal structure to maintain a stable coordinate reference Instead strapdown systems replace the gimbal structure by a direction cosine matrix which is contained in and updated by the system computer To assess the performance of a strapdown system or to determine the computer requirements a detailed study of the computational error introduced by the computer is necessary This report is concerned with the techniques which may be employed to estimate the computational error and its effects on system performance Although focused upon a particular problem of practical importance many of the techniques have a wider applicability to aerospace in general
