Giant Planets:

Giant Planets of Our Solar System Patrick G. J. Irwin, Patrick Irwin, 2006-01-27 This book reviews the current state of knowledge of the atmospheres of the four giant gaseous planets. It is the first book to contain all the latest data and background information on these planets in one handy volume. Current theories of their formation are reviewed. The book clearly explains all specialist terms and it discusses the pros and cons of ground versus space based observations of giant planets.

20 Fun Facts About Gas Giants Arielle Chiger, Matthew Elkin, 2014-08-01 You might think that Earth is a big planet but it's nothing compared to our solar system's gas giants Jupiter, Saturn, Uranus, and Neptune. Jupiter itself could hold 1,300 Earths. With their beautiful colors, many moons, and planetary rings, the gas giants are some of the most fascinating space topics for readers to explore. The manageable text, aligned to the science curriculum, is made more accessible by the inclusion of amazing images, diagrams, and graphic organizers.

The Magnetodiscs and Aurorae of Giant Planets Karoly Szego, Nicholas Achilleos, Chris Arridge, Sarah Badman, Peter Delamere, Denis Grodent, Margaret Galland Kivelson, Philippe Louarn, 2015-10-14 Readers will find grouped together here the most recent observations, current theoretical models, and present understanding of the coupled atmosphere, magnetosphere, and solar wind system. The book begins with a general discussion of mass, energy, and momentum transport in magnetodiscs. The physics of partially ionized plasmas of the giant planet magnetodiscs is of general interest throughout the field of space physics, heliophysics, and astrophysical plasmas; therefore, understanding the basic physical processes associated with magnetodiscs has universal applications. The second chapter characterizes the solar wind interaction and auroral responses to solar wind driven dynamics. The third chapter describes the role of magnetic reconnection and the effects on plasma transport. Finally, the last chapter characterizes the spectral and spatial properties of auroral emissions, distinguishing between solar wind drivers and internal driving mechanisms. The in-depth reviews provide an excellent reference for future research in this discipline.

Giant Planets of Our Solar System Patrick Irwin, 2009-03-27 This book reviews the current state of knowledge of the atmospheres of the giant gaseous planets Jupiter, Saturn, Uranus, and Neptune. The current theories of their formation are reviewed, and their recently observed temperature, composition, and cloud structures are contrasted and compared with simple thermodynamic, radiative transfer, and dynamical models. The instruments and techniques that have been used to remotely measure their atmospheric properties are also reviewed, and the likely development of outer planet observations over the next two decades is outlined. This second edition has been extensively updated following the Cassini mission results for Jupiter, Saturn, and the newest ground-based measurements for Uranus, Neptune, as well as on the latest development in the theories on planet formation.
