The Maps That Change Florida's History James MacDougald, 2021-06-09 The First European Colony in the United States Juan Ponce de Le n the discoverer and first governor of La Florida established the first European colony in the United States on the west coast of Florida in 1521 Although its location has never been determined historians have theorized that it likely occurred somewhere in the Charlotte Harbor area The settlement is believed to have lasted only three to four months It was abandoned when conflict with the local Indians resulted in Juan Ponce being mortally wounded The survivors took him to Cuba where he died of his wounds In 1528 seven years after the Ponce de Le n settlement had been abandoned P nfilo de Narv ez landed just north of the entrance to Tampa Bay with an expedition of 400 men and 10 women On one of their first inland expeditions they encountered the Tocobaga Indians at their main village in today s Safety Harbor where they found many cargo boxes and European artifacts that may have been remnants of the Ponce de Le n settlement The inland exploration by Narv ez and three hundred of his men seeking a non existent large bay to their north resulted in the deaths of

all but four who became the first to explore inland North America finally reaching the Pacific eight years later Rare and seldom seen Spanish maps produced by the royal mapmakers in Seville in 1527 show the location and latitude for the Bay of Juan Ponce MacDougald produces compelling evidence that Narv ez was seeking the Bay of Juan Ponce and that the first European colony established in the United States occurred in Tampa Bay likely in the area known today as Safety Harbor in Old Tampa Bay the site of the Tocobaga village visited by Narv ez

Water Snowline in Protoplanetary Disks Shota Notsu,2020-09-01 This book presents pioneering work on a critical observational test of the planet formation theory based on the theoretical study of the water snowline beyond which water takes the form of ice in the protoplanetary disks the place where planets are formed Since the water snowline is thought to divide the regions of rocky and gas giant planet formation the location of the snowline is essential for the planet formation process The book proposes a novel method to locate the snowlines using high dispersion spectroscopic observations of water vapor lines which is based on in sophisticated chemical modeling and line radiative transfer calculations The author obtained the water vapor distribution in the disks using the chemical reaction network which includes photoreactions and gas grain interactions The simulated transition lines of water vapor in the disks demonstrate that relatively weak transition lines with moderate excitation energies are the best tracers of water snowline Furthermore the author observed submillimeter lines of water vapor in a disk using ALMA Atacama Large Millimeter submillimeter Array to obtain the upper limit of the line fluxes with the highest sensitivity to date These unprecedented findings are important in locating the snowlines in the disks and the method goes a long way toward achieving a comprehensive understanding of the planet formation processes as well as of the origin of water on rocky planets including our Earth based on future observations using ALMA and SPICA Space Infrared Telescope for Cosmology and Astrophysics
