## **Inotropic Stimulation And Myocardial Energetics Basic Research In Cardiology:**

**Inotropic Stimulation and Myocardial Energetics** Hanjörg Just, Ch Holubarsch, H. Scholz, 1989-01-01 *Inotropic Stimulation and Myocardial Energetics* Hanjörg Just, Ch Holubarsch, H. Scholz, 1989-01-01 **Alterations of Excitation-Contraction Coupling in the Failing Human Heart** Gerd Hasenfuss, Hanjörg Just, 2012-12-06 Alteration of excitation contraction coupling in the failing human heart was deemed an interesting subject for a dialogue between basic scientists and clinical researchers in continuation of previous Gargellen Conferences concerned with the function of the normal and failing human myocardium In 1987 basic mechanisms and clinical implications of then new insights into cardiac energetics was followed by a comprehensive review of inotropic stimulation and myocardial energetics in 1989 Here we undertook a re evaluation of the principles of inotropic stimulation and of its potential therapeutic value based on new observations from experiments with human myocardium In 1992 the risk due to myocardial phenotype change as a consequence of adaptation in heart failure was published Here alterations of subcellular structures and functions as a consequence of chronic heart failure summarized as phenotype change could be described as an essential characteristic of the failing human myocardium This topic was discussed in greater depth in the volume *Cellular and Molecular Alterations in the Failing Human Heart* considering both the sarcolemma and the phosphodiesterases as well as excitation contraction coupling and contractile proteins extracellular matrix and mitochondrial function *Mechanics and Energetics of the Myocardium* Christian J.F. Holubarsch, 2012-12-06 During several decades of this century the classical physiological studies on the cardiovascular system have greatly improved our knowledge on the function of this system under normal and pathological conditions This knowledge was the basis of the breakthrough for diagnostic techniques like the Swan Ganz catheter coronary arteriography left and right heart biopsies and invasive measurements of contractility as well as therapeutic tools including aortocoronary bypass surgery percutaneous transluminal coronary angioplasty and a broad field of pharmacological interventions for the whole spectrum of cardiovascular diseases especially chronic heart failure It was during the last decade that the scientific world focused on the evolution of molecular biology of the cardiovascular system so that cardiovascular physiology seemed to become less important Regarding the myocardium molecular alterations of important functional proteins phenotype changes as well as signal transduction pathways of contractility and cardiac growth have been elucidated The functional importance of a number of genes has undoubtedly been proven with the help of transgenic animals *Mechanics and Energetics of the Myocardium* provides an overview for those researchers and practitioners interested in the broad field of molecular biology and physiology of the cardiovascular system *Modulation of Cardiac Calcium Sensitivity* John A. Lee, David G. Allen, 1993 Calcium sensitizers are a new class of drug which increases the force of contraction of the heart by increasing the calcium sensitivity of contractile proteins Their development represents the first major innovation in the treatment of heart failure for over 200 years Unlike other drugs in this area they do not increase the

intracellular calcium concentration and do not have the side effects associated with that mechanism of action. These drugs offer an exciting alternative approach to the treatment of heart failure and this volume provides an authoritative overview of the physiology, biochemistry and clinical issues involved. It will be of interest to pharmacologists, research and clinical cardiologists and physiologists. *From Molecule to Man* M. Zehender, G. Breithardt, H. Just, 2012-12-06. From molecule to man: Medical research has indeed taken this direction and major improvements of our understanding of the pathophysiology and epidemiology of disease have been achieved. The molecular basis of the congenital cardiovascular disorders has been extended from relatively few congenital malformations into everyday illnesses such as diabetes mellitus, hyperlipoproteinaemia and arterial hypertension. The monogenic and more difficult polygenic basis for a vast majority of cardiovascular disorders are being defined more precisely from year to year. This book gives an overview of what has been achieved so far and defines the current position. Cardiac Energetics R. Jacob, Hanjoerg Just, C. Holubarsch, 2013-04-17. Assessment of cardiac energetics at the level of ATP synthesis, chemomechanical energy transformation and whole organ dynamics as a function of haemodynamic load, ventricular configuration and oxygen and substrate supply is basic to understanding cardiac function under physiological and pathophysiological hypertrophy, hypoxia, ischaemia and heart failure conditions. Moreover, cardiac energetics should be an important consideration in the choice and application of drugs, especially in the case of vasodilators, inotropic agents and in cardioprotective measures. Only by considering energetics at the subcellular, cellular and whole heart level can we arrive at a better understanding of cardiac performance and ultimately better clinical judgement and drug therapy. Quantification of myocardial energetics will also help to determine the optimal time for surgical interventions such as valvular replacement or aneurysm resection. The present volume is the outcome of an international symposium on cardiac energetics held in Gargellen, Montafon, Austria, June 1986. The contributions will certainly help bridge the existing gap between basic research involving isolated structures and that involving the whole organ, on the one hand, and render the results derived from basic research applicable to clinical problems on the other hand. Cumulated Index Medicus, 1994. Molecular Structure and Biological Activity of Steroids Martin Bohl, 2018-01-18. Molecular Structure and Biological Activity of Steroids focuses on the identification of steroid structural features that control particular biological effects. Steroid geometry plays a critical role in steroid activity; therefore, the results of X-ray crystallographic, NMR spectroscopic and theoretical studies on structure-activity relationships form an integral part of the book. Well-established observations and proposed models are presented, summarizing knowledge of molecular features, e.g. steroid backbone, structures, side chain constitutions, substitution sites, configurations, hydrogen bonding patterns that can affect steroid action. The book also provides overviews about recent progress in various frontier fields of steroid research, including such areas as sex steroids, glucocorticoids, aromatase inhibitors, vitamin D metabolites, brassinosteroids, neuromuscular blocking agents and cardiotonic steroids. *Molecular Structure and Biological Activity of Steroids* is a must-have resource for biochemists.

*Cardiac Metabolism in Health and Disease* Salah Abdel-aleem,James E. Lowe,2012-12-06 This special issue of Molecular and Cellular Biochemistry contains original research papers as well as invited reviews focused in the field of cardiac metabolism and its regulation under normal and disease conditions These papers cover many areas under intensive and rapid development such as the regulation of fatty acid oxidation in the heart the role of cardiac glycogen during ischemia the role of CPT I isoenzymes the pathophysiology of diabetic cardiomyopathy cardiac protection through regulation of energy production the role of fatty acid binding protein under normal and pathological conditions and several other important topics in this area of research We hope that this special issue of Molecular and Cellular Biochemistry provides an up to date source of information for scientists and clinicians interested in the mechanism by which cardiac metabolism is regulated in health and disease and the mechanistic relationship between disturbances in cardiac metabolism and the genesis of cardiovascular diseases      *Cardiovascular Problems in Pediatric Critical Care* David B. Raphaely,1986      National Library of Medicine Current Catalog National Library of Medicine (U.S.),1990      **Endothelial Modulation of Cardiac Function** Malcolm J Lewis,Ajay M Shah,2020-01-29 Paracrine and autocrine regulation of cardiac function by endothelial mediators is becoming important both physiologically and pathophysiologically This volume brings the researcher completely up to date with all aspects of endothelial regulation and cardiac function Acknowledged experts in each field have contributed making this work indispensable for researchers and of great interest to the clinical cardiologist The Endothelial Cell Research Series publishes significant reviews by experts in the field The individual volumes provide invaluable guides to researchers studying endothelial cells and are effective reference texts for anyone working in the general areas of vascular biology and neurotransmission Endothelium was originally considered to be an inert lining for the blood vessels but during the last fifteen years this view has had to be completely revised It is now accepted that the endothelium plays an important role in many diverse functions This volume concentrates on the effect of the endothelium on cardiac function It has been widely demonstrated that the endothelium exerts a paracrine influence on contraction of adjacent cardiac muscle through the release of several mediators such as endothelin and nitric oxide Recent studies also show that the effects of such mediators upon the heart are not limited to contraction alone      **Mitochondria: Hubs of Cellular Signaling, Energetics and Redox Balance** Miguel A. Aon,Amadou K. S. Camara,2017-08-11 Poised at the convergence of most catabolic and anabolic pathways mitochondria are the center of heterotrophic aerobic life representing a hub in the overall metabolic

network of cells The energetic functions performed by mitochondria face the unavoidable redox hurdle of handling huge amounts of oxygen while keeping its own as well as the cellular redox environment under control Reactive oxygen species ROS are produced in the respiratory chain as a result of the energy supplying function of mitochondria Originally considered an unavoidable by product of oxidative phosphorylation ROS have become crucial signaling molecules when their levels are kept within physiological range This occurs when their production and scavenging are balanced within mitochondria and cells Mitochondria generated hydrogen peroxide can act as a signaling molecule within mitochondria or in the cytoplasm affecting multiple networks that control for example cell cycle stress response cell migration and adhesion energy metabolism redox balance cell contraction and ion channels However under pathophysiological conditions excessive ROS levels can happen due to either overproduction overwhelming of antioxidant defenses or both Under oxidative stress detrimental effects of ROS include oxidation of protein lipids and nucleic acids mitochondrial depolarization and calcium overload and cell wide oscillations mediated by ROS induced ROS release mechanisms Mitochondrial dysfunction is central in the pathogenesis of numerous human maladies including cardiomyopathies and neurodegeneration Diseases characterized by altered nutrient metabolism such as diabetes and cancer exhibit elevated ROS levels These may contribute to pathogenesis by increasing DNA mutation affecting regulatory signaling and transcription and promoting inflammation Under metabolic stress several ionic channels present in the inner and outer mitochondrial membranes can have pro life and death effects In the present E book based on the Frontiers Research Topic entitled Mitochondria Hubs of cellular signaling energetics and redox balance we address one of the fundamental questions that the field of ROS biology faces today how do mitochondria accomplish a reliable energy provision and at the same time keep ROS levels within physiological non harming limits but crucial for cellular signaling function Additionally and within the perspective of mitochondria as signaling energetic hubs in the extensive cellular metabolic network we ask how can their collective dynamics scale from the subcellular to the cellular tissue and organ levels to affect function in health and disease
