**Ising-Type Antiferromagnets** Christian Binek, 2014-01-15 *Magnetic Excitations and Fluctuations II* Umberto Balucani, Stephen W. Lovesey, Mario G. Rasetti, Valerio Tognetti, 2012-12-06 An international workshop on Elementary Excitations and Fluctuations in Magnetic Systems was held in Turin for five days beginning 25 May 1987 The workshop followed much the same format as the one with the same title held in San Miniato in 1984 proceedings Springer Series in Solid State Sciences Vol 54 that most participants contributed talks and provided papers for the proceedings While many of the participants had attended the first workshop 15 of the 40 invited review papers were presented by scientists who had not The majority of the talks reported theoretical work concerned with the introduction of new techniques However experimental work was also well represented not least because many of the reported theoretical studies were motivated by experimental findings and a highlight of the workshop was an extremely stimulating session devoted to recent neutron scattering measurements on various systems that exploited polarization analysis The fine venue of the workshop Villa Gualino with its excellent facilities and spacious accommodation helped to produce a delightful relaxed and friendly atmosphere For the use of Villa Gualino and significant financial support we are indebted to our host organization the Institute for Scientific Interchange ISI Additional financial support came from the Consiglio Nazionale delle Ricerche CNR Centro Interuniversitario di Struttura della Materia del Ministero della Pubblica Istruzione CISM MPI and Gruppo Nazionale di Struttura della Materia GNSM CNR

Stability of Materials A. Gonis,Josef Kudrnovský,Patrice E.A. Turchi,2012-12-06 Engineering

materials with desirable physical and technological properties requires understanding and predictive capability of materials behavior under varying external conditions such as temperature and pressure. This immediately brings one face to face with the fundamental difficulty of establishing a connection between materials behavior at a microscopic level where understanding is to be sought and macroscopic behavior which needs to be predicted. Bridging the corresponding gap in length scales that separates the ends of this spectrum has been a goal intensely pursued by theoretical physicists, experimentalists and metallurgists alike. Traditionally the search for methods to bridge the length scale gap and to gain the needed predictive capability of materials properties has been conducted largely on a trial and error basis guided by the skill of the metallurgist, large volumes of experimental data and often ad hoc semi phenomenological models. This situation has persisted almost to this day and it is only recently that significant changes have begun to take place. These changes have been brought about by a number of developments, some of long standing others of more recent vintage.

Ising-type Antiferromagnets Christian Binek, 2001. The book deals with selected modern aspects of artificially layered structures and bulk materials involving antiferromagnetic long range order. Special emphasis is laid on the prototypical behavior of Ising type model systems. They play a crucial role in the field of statistical physics and in addition contribute to the basic understanding of the exchange bias phenomenon in MBE grown magnetic heterosystems. Throughout the book particular attention is given to the interplay between experimental results and their theoretical description ranging from the famous Lee Yang theory of phase transitions to novel mechanisms of exchange bias.

**Chemical Physics of Intercalation** A.P. Legrand, A. Flandrois, 2013-12-11. Conjugated polymers such as polyacetylene  $\text{CH}_x$ , polyphenylene  $\text{C}_6\text{H}_4$ , polythiophene  $\text{C}_4\text{H}_2\text{S}$  etc which are insulators in their pristine state can be brought to the metallic state after doping with chemical species which can be either electron donors or acceptors. This doping process involves a charge transfer between the dopant molecule and the polymer chain which are then supposed to be spatially close to each other. It follows that the mechanism of doping must be considered as an actual intercalation process which will greatly affect the structural characteristics of the starting material as well as its morphology as has been observed during the 2 intercalation of graphite and layered compounds. In parallel with these modifications the band structure of the system changes yielding a new set of electronic properties. It is evident therefore that the structural and electronic properties are intimately related and must be studied simultaneously in the same system to give reliable information. A great number of studies have been devoted to the structural and electronic properties of conjugated polymers after a chemical or 2 electrochemical doping process. Most of these concern the properties of the system for a given dopant concentration. With this approach a universal picture of the polymer dopant system is very difficult to obtain as a comparison between different experiments is very hazardous. On the other hand only a small number of measurements have been performed during the continuous electrochemical doping of various polymers.
