

Floating Leaf Disk Photosynthesis Lab

Background:

Photosynthesis is a process that converts carbon dioxide into sugars such as glucose using energy from the sun. When light is absorbed by pigments in a leaf, the energy absorbed is used to incorporate the carbon dioxide into organic molecules in a process called carbon fixation.

The process of photosynthesis can be expressed by the following word equation and chemical equation.

Carbon dioxide + Water + Light energy → Glucose + Oxygen

$6\text{CO}_2 + 6\text{H}_2\text{O} + \text{Light energy} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$

In this lab, you will be using spinach leaf disks to assay (analyze) the net rate of photosynthesis under various lighting conditions. Leaf disks normally float, however when the air spaces are infiltrated with carbon dioxide, the overall density of the leaf disk increases and leaf disk sinks. When sodium bicarbonate is added to the water, the bicarbonate ion acts as a carbon source for photosynthesis causing the leaf disks to sink. As photosynthesis proceeds, oxygen is released into the interior of the leaf, which changes its buoyancy (does it float or not) causing the disk to rise. Since cellular respiration is taking place at the same time in the leaf, the oxygen generated by photosynthesis is consumed. As a result, the rate that the disks rise is indirectly proportional to the net rate of photosynthesis.

Purpose: To observe the rate of photosynthesis under different lighting conditions (direct, ambient, dark).

Question: How does the condition of light sources affect the rate of photosynthesis?

Materials:

300 mL Sodium bicarbonate

1 drop liquid soap

1 Syringe

2 Fresh spinach leaves

Hole punch

Lamp

3 Stir sticks

3 Plastic cups
