Exploring New Frontiers Of Theoretical Informatics:

Exploring New Frontiers of Theoretical Informatics Jean-Jacques Lévy, Ernst W. Mayr, John C. Mitchell, 2006-04-11 In recent years IT application scenarios have evolved in very innovative ways Highly distributed networks have now become a common platform for large scale distributed programming high bandwidth communications are inexpensive and widespread and most of our work tools are equipped with processors enabling us to perform a multitude of tasks In addition mobile computing referring specifically to wireless devices and more broadly to dynamically configured systems has made it possible to exploit interaction in novel ways To harness the flexibility and power of these rapidly evolving interactive systems there is need of radically new foundational ideas and principles there is need to develop the theoretical foundations required to design these systems and to cope with the many complex issues involved in their construction and there is need to develop effective principles for building and analyzing such systems Reflecting the diverse and wide spectrum of topics and interests within the theoretical computer science community *Exploring New Frontiers of Theoretical Informatics* is presented in two distinct but interrelated tracks Algorithms Complexity and Models of Computation Logic Semantics Specification and Verification *Exploring New Frontiers of Theoretical Informatics* contains 46 original and significant contributions addressing these foundational questions as well as 4 papers by outstanding invited speakers These papers were presented at the 3rd IFIP International Conference on Theoretical Computer Science TCS 2004 which was held in conjunction with the 18th World Computer Congress in Toulouse France in August 2004 and sponsored by the International Federation for Information Processing IFIP

Analysis of Real-World Security Protocols in a Universal Composability Framework Max Tuengerthal,2013

Security protocols employed in practice are used in our everyday life and we heavily depend on their security The complexity of these protocols still poses a big challenge on their comprehensive analysis To cope with this complexity a promising approach is modular security analysis based on universal composability frameworks such as Canetti's UC model This appealing approach has however only very rarely been applied to the analysis of existing real world protocols Either the analysis was not fully modular or it could only be applied to idealized variants of the protocols The main goal of this thesis therefore is to push modular protocol analysis as far as possible but without giving up on accurate modeling Our main contributions in a nutshell An ideal functionality for symmetric key cryptography that provides a solid foundation for faithful composable cryptographic analysis of real world security protocols A computational soundness result of formal analysis for key exchange protocols that use symmetric encryption Novel universal and joint state composition theorems that are applicable to the analysis of real world security protocols Case studies on several security protocols SSL TLS IEEE 802.11i WPA2 SSH IPsec and EAP PSK We showed that our new composition theorems can be used for a faithful modular analysis of these protocols In addition we proved composable security properties for two central protocols of the IEEE standard 802.11i namely the 4 Way Handshake Protocol and the CCM Protocol This constitutes the first rigorous cryptographic analysis of these protocols While our applications focus on real world security protocols our theorems models and techniques should be useful beyond this domain
