**Mineral Resources** Manuel Bustillo Revuelta, 2017-08-23 This comprehensive textbook covers all major topics related to the utilization of mineral resources for human activities. It begins with general concepts like definitions of mineral resources, mineral resources and humans, recycling mineral resources, distribution of minerals, resources across Earth, and international standards in mining, among others. Then it turns to a classification of mineral resources covering the main types from a geological standpoint. The exploration of mineral resources is also treated, including geophysical methods of exploration, borehole geophysical logging, geochemical methods, drilling methods, and mineral deposit models in exploration. Further, the book addresses the evaluation of mineral resources from sampling techniques to the economic evaluation of mining projects, i.e., types and density of sampling, mean grade definition and calculation, Sichel's estimator, evaluation methods, classical and geostatistical, economic evaluation, NPV, IRR, and PP estimation of risk, and software for evaluating mineral resources. It subsequently describes key mineral resource exploitation methods: open pit and underground mining, and the mineral processing required to obtain saleable products: crushing, grinding, sizing, ore separation, and concentrate dewatering, also with some text devoted to tailings dams. Lastly, the book discusses the environmental impact of mining, covering all the aspects of this very important topic from the description of diverse impacts to the environmental impact assessment (EIA), which is essential in modern mining projects.

**Formal Concept Analysis** Raoul Medina, Sergei Obiedkov, 2008-02-11 Formal Concept Analysis (FCA) is a mathematical theory of concepts and concepts. The hierarchy leading to methods for conceptually analyzing data and knowledge. The theory itself strongly relies on order and lattice theory, which has been studied by mathematicians over decades. FCA proved itself highly relevant in several applications from the beginning, and over the last years, the range of applications has kept growing. The main reason for this comes from the fact that our modern society has turned into an information society. After years and years of using computers, companies realized they had stored gigantic amounts of data. Then they realized that this data, just rough information for them, might become a real treasure if turned into knowledge. FCA is particularly well suited for this purpose. From relational data, FCA can extract implications, dependencies, concepts, and hierarchies of concepts, and thus capture part of the knowledge hidden in the data. The ICFCA conference series gathers researchers from all over the world, being the main forum to present new results in FCA and related fields. These results range from theoretical novelties to advances in FCA-related algorithmic issues, as well as application domains of FCA. ICFCA 2008 was in the same vein as its predecessors: high quality papers and presentations, the place of real debate and exchange of ideas. ICFCA 2008 contributed to strengthening the links between theory and applications. The high quality of the presentations was the result of the remarkable work of the authors and the reviewers. We wish to thank the reviewers for all their valuable comments, which helped the authors to improve their presentations.

**GIS** K. Elangovan, 2006 Geographic Information Systems, or popularly known as GIS, has been developing its roots since the role of remote sensing has increased. It spreads its branches to civil engineering, geosciences,

forestry disaster mitigation ecology and environment and various other fields The book explains the concepts of GIS in a simple language Topics like development of GIS data structures database concepts map projections requirement of hardware and software for implementing GIS errors and removing errors advanced analysis are a few chapters to be named which find place in this book
