Exploration of Near Earth Objects Committee on Planetary and Lunar Exploration, Commission on Physical Sciences, Mathematics, and Applications, Space Studies Board, Division on Engineering and Physical Sciences, National Research Council, 1998-05-18 Comets and asteroids are in some sense the fossils of the solar system They have avoided most of the drastic physical processing that shaped the planets and thus represent more closely the properties of the primordial solar nebula What processing has taken place is itself of interest in decoding the history of our solar neighborhood Near Earth objects are also of interest because one or more large ones have been blamed for the rare but devastating events that caused mass extinctions of species on our planet as attested by recent excitement over the impending passage of asteroid 1997 XF11 The comets and asteroids whose orbits bring them close to Earth are clearly the most accessible to detailed investigation both from the ground and from spacecraft When nature kindly delivers the occasional asteroid to the surface of Earth as a meteorite we can scrutinize it closely in the laboratory a great deal of information about primordial chemical composition and primitive processes has been gleaned from such objects This report reviews the current state of research on near Earth objects and considers future directions Attention is paid to the important interplay between ground based investigations and spaceborne observation or sample collection and return This is particularly timely since one U S spacecraft is already on its way to rendezvous with a near Earth object and two others plus a Japanese mission are being readied for launch In addition to scientific issues the report considers technologies that would enable further advances in capability and points out the possibilities for including near Earth objects in any future expansion of human exploration beyond low Earth orbit

**Discovering the Universe** William J.

Kaufmann, Neil F. Comins, 2008-12-26 *Discovering the Universe From the Stars to the Planets* engages students with an inquiry based exploration of the universe and the scientific process. Developed with a big picture approach, the text first explains how the stars, the galaxies and the entire universe formed and then discusses planets and other components of our solar system. Students follow this natural conceptual progression within a proven learning method designed to address misconceptions and build a deep understanding of science and the world around us. **Commercial Space Exploration** Jai Galliot, 2016-03-09 Not since man set foot on the moon over four decades ago has there been such passion and excitement about space exploration. This enthusiasm and eagerness has been spurred on by the fact that for the first time since the very beginning of the space age, space travel is no longer limited to an elite group of highly trained and well disciplined military officers and test pilots. Instead, we must understand that the possibility of commercial space travel is already on our horizon and that it comes with a number of significant practical and moral challenges. Our level of scientific development and ability to influence international affairs and policy confers upon us an obligation to study the ethical, legal and social considerations associated with space exploration and understanding the potential consequences from the beginning is critical. This volume provides the first comprehensive and unifying analysis concerning the rise of private space exploration with a view toward developing policy that may influence real world decision making. The plethora of questions demanding serious attention: privatisation and commercialisation, the impact on the environment, health, futures, risk assessment, responsibility and governance are directly addressed in this scholarly work.
