Stewart Fotheringham, Chris Brunsdon, Martin Charlton, 2003-02-21 Geographical Weighted Regression GWR is a new local modelling technique for analysing spatial analysis This technique allows local as opposed to global models of relationships to be measured and mapped This is the first and only book on this technique offering comprehensive coverage on this new hot topic in spatial analysis Provides step by step examples of how to use the GWR model using data sets and examples on issues such as house price determinants educational attainment levels and school performance statistics Contains a broad discussion of and basic concepts on GWR through to ideas on statistical inference for GWR models uniquely features accompanying author written software that allows users to undertake sophisticated and complex forms of GWR within a user friendly Windows based front end see book for details

Geographically Weighted Regression A. Stewart Fotheringham, 2002 Geographically Weighted Regression The Analysis of Spatially Varying Relationships is based on the premise that relationships between variables measured at different locations might not be constant over space The prevailing assumption is that such relationships are constant an assumption that would appear to be the result of convenience rather than of any serious examination of the issues If relationships do vary significantly over space then serious questions are raised about the reliability of traditional global level analyses Geographically Weighted Regression as part of a broader research area in local modelling provides a new analytical tool and a different perspective on spatial analysis Instead of being restricted to simple global analyses in which interesting local variations in relationships are averaged away and unobservable GWR allows local relationships to be measured and mapped In many ways the output from GWR is similar to that presented by a microscope previously unimagined detail suddenly comes into focus This book challenges many of the global statements of spatial relationships that have been made in the academic literature Geographically Weighted Regression The Analysis of Spatially Varying Relationships contains a broad discussion of local models in general and of the details of GWR and provides many empirical examples on issues such as house price determinants educational attainment levels and school performance statistics A unique accompanying feature of this book is the author written software that allows users to undertake sophisticated and complex forms of GWR within a user friendly Windows based front end This software is readily available from the authors and notes on using the software and an example application are documented in the book itself Geographically Weighted Regression The Analysis of Spatially Varying Relationships is an essential resource for quantitative spatial analysts and GIS researchers and students It will be of interest to researchers in any discipline in which spatial data are used across the broad spectrum of social sciences medicine science and engineering The underlying message is that locality is important and measuring local relationships is vital to understanding spatial processes Stewart Fotheringham and his colleagues have produced a book that will be widely used by geographers and others interested in spatial analysis Geographically weighted regression is an important method and the

authors have developed and explained it well Peter Rogerson Department of Geography University at Buffalo USA The realisation that almost any statistic can be made local and that mapping the results almost always leads to greater insight is powering a revolution in spatial analysis In particular the localisation of standard regression models or GWR has led to important and powerful insights This book written by the team that has done most to develop it makes this approach accessible for the first time under a single cover It should be required reading for anyone involved with the analysis of spatially referenced data David Unwin School of Geography Birkbeck College London Publisher description

The availability of these valuable sources of information makes the advanced models suggested in the spatial statistic and econometric literature applicable to agricultural economics. This book aims at supporting stakeholders to design spatial surveys for agricultural data and or to analyse the geographically collected data This book attempts to describe the main typology of agricultural data and the most appropriate methods for the analysis together with a detailed description of the available data sources and their collection methods Topics such as spatial interpolation point patterns spatial autocorrelation survey data analysis small area estimation regional data modelling and spatial econometrics techniques are covered jointly with issues arising from the integration of several data types.
