Guidelines for Mechanical Integrity Systems CCPS (Center for Chemical Process Safety),2017-04-11 In recent years process safety management system compliance audits have revealed that organizations often have significant opportunities for improving their Mechanical Integrity programs As part of the Center for Chemical Process Safety s Guidelines series Guidelines for

Mechanical Integrity Systems provides practitioners a basic familiarity of mechanical integrity concepts and best practices. The book recommends efficient approaches for establishing a successful MI program.

Guidelines for Inherently Safer Chemical Processes CCPS (Center for Chemical Process Safety), 2019-10-11. Since the publication of the second edition, several United States jurisdictions have mandated consideration of inherently safer design for certain facilities. Notable examples are the inherently safer technology (IST) review requirement in the New Jersey Toxic Chemical Prevention Act (TCPA) and the Inherently Safer Systems Analysis (ISSA) required by the Contra Costa County California Industrial Safety Ordinance. More recently, similar requirements have been proposed at the U.S. Federal level in the pending EPA Risk Management Plan (RMP) revisions. Since the concept of inherently safer design applies globally with its origins in the United Kingdom, the book will apply globally. The new edition builds on the same philosophy as the first two editions but further clarifies the concept with recent research, practitioner observations, added examples, and industry methods and discussions of security and regulatory issues. *Inherently Safer Chemical Processes* presents a holistic approach to making the development, manufacture, and use of chemicals safer. The main goal of this book is to help guide the future state of chemical process evolution by illustrating and emphasizing the merits of integrating inherently safer design, process-related research, development, and design into a comprehensive process that balances safety, capital, and environmental concerns throughout the life cycle of the process. It discusses strategies of how to substitute more benign chemicals at the development stage, minimize risk in the transportation of chemicals, use safer processing methods at the manufacturing stage, and decommission a manufacturing plant so that what is left behind does not endanger the public or environment.

Guidelines for Combustible Dust Hazard Analysis CCPS (Center for Chemical Process Safety), 2017-04-26. This book describes how to conduct a Combustible Dust Hazard Analysis (CDHA) for processes handling combustible solids. The book explains how to do a dust hazard analysis by using either an approach based on compliance with existing consensus standards or by using a risk-based approach. Worked examples in the book help the user understand how to do a combustible dust hazards analysis.

Guidelines for Initiating Events and Independent Protection Layers in Layer of Protection Analysis CCPS (Center for Chemical Process Safety), 2015-02-03. The book is a guide for Layers of Protection Analysis (LOPA) practitioners. It explains the onion skin model and, in particular, how it relates to the use of LOPA and the need for non-safety instrumented independent protection layers. It provides specific guidance on Independent Protection Layers (IPLs) that are not Safety Instrumented Systems (SIS). Using the LOPA methodology, companies typically take credit for risk reductions accomplished through non-SIS alternatives, i.e., administrative procedures, equipment design, etc. It addresses issues such as how to ensure the effectiveness and maintain reliability for administrative controls or inherently safer passive concepts. This book will address how the fields of Human Reliability Analysis, Fault Tree Analysis, Inherent Safety Audits and Assessments, Maintenance, and Emergency Response relate to LOPA and SIS. The book will separate IPLs into categories such as the following: Inherent Safety eliminates a scenario or

fundamentally reduces a hazard Preventive Proactive prevents initiating event from occurring such as enhanced maintenance Preventive Active stops chain of events after initiating event occurs but before an incident has occurred such as high level in a tank shutting off the pump Mitigation active or passive minimizes impact once an incident has occurred such as closing block valves once LEL is detected in the dike active or the dike preventing contamination of groundwater passive **Active**
