Jms Programming Service:

Semantic Service Provisioning Dominik Kuroпка, Peter Tröger, Steffen Staab, Mathias Weske, 2008-04-19 Service oriented computing has recently gained extensive momentum in both industry and academia and major software vendors hook on to the service paradigm and tailor their software systems towards services in order to accommodate ever changing process and product requirements in today's dynamic market environments While dynamic binding of services at runtime was identified as a core functionality of service based environments as far back as 2000 its industrial strength implementation has yet to be achieved The main reason for this is the lack of rich service specifications concepts and tools to process them This book introduces advanced concepts in service provisioning and service engineering including semantic concepts dynamic discovery and composition and illustrates them in a concrete business use case scenario To prove the validity of the concepts and technologies a semantic service provisioning reference architecture framework as well as a prototypical implementation of its subsystems and a prototypical realization of a proper business scenario are presented Thus the book goes way beyond current service based software technologies by providing a coherent and consistent set of technologies and systems functionality that realizes advanced concepts in service provisioning Both the use case scenario and the provisioning platform have already been substantiated and implemented by the EU funded Adaptive Services Grid project The book therefore presents state of the art research results that have already passed a real industrial implementation evaluation which is based on the work of over 20 European partners cooperating in the field of semantic service provisioning

Enterprise Service Bus David A Chappell, 2004-06-25 Large IT organizations increasingly face the challenge of integrating various web services applications and other technologies into a single network The solution to finding a meaningful large scale architecture that is capable of spanning a global enterprise appears to have been met in ESB or Enterprise Service Bus Rather than conform to the hub and spoke architecture of traditional enterprise application integration products ESB provides a highly distributed approach to integration with unique capabilities that allow individual departments or business units to build out their integration projects in incremental digestible chunks maintaining their own local control and autonomy while still being able to connect together each integration project into a larger more global integration fabric or grid Enterprise Service Bus offers a thorough introduction and overview for systems architects system integrators technical project leads and CTO CIO level managers who need to understand assess and evaluate this new approach Written by Dave Chappell one of the best known and authoritative voices in the field of enterprise middleware and standards based integration the book drills down into the technical details of the major components of ESB showing how it can utilize an event driven SOA to bring a variety of enterprise applications and services built on J2EE NET C C and other legacy environments into the reach of the everyday IT professional With Enterprise Service Bus readers become well versed in the problems faced by IT organizations today gaining an understanding of how current technology deficiencies impact

business issues Through the study of real world use cases and integration patterns drawn from several industries using ESB including Telcos financial services retail B2B exchanges energy manufacturing and more the book clearly and coherently outlines the benefits of moving toward this integration strategy The book also compares ESB to other integration architectures contrasting their inherent strengths and limitations If you are charged with understanding assessing or implementing an integration architecture Enterprise Service Bus will provide the straightforward information you need to draw your conclusions about this important disruptive technology

Enterprise JavaBeans 2.1 Rob Castaneda, Ingo Peters, Stefan Denninger, 2008-01-01 Enterprise JavaBeans EJB is a server side component model for transaction aware distributed enterprise applications written in the Java programming language Enterprise JavaBeans 2.1 details the architecture of the Enterprise JavaBeans component model After the authors introduce the component paradigm they move on to cover EJB architecture basics Building on the foundation formed in those introductory topics they discuss the different component types session entity and message driven beans in detail This is followed by a comprehensive introduction to the Java Message Service JMS so you understand the ideas behind asynchronous and parallel processing provided through message driven beans Transactions security and the newly introduced timer service round out the book This invaluable resource also discusses topics beyond the specification inheritance coupling of EJB components quality assurance and more After reading this book you will understand the benefits and the limits of EJB and have the knowledge necessary to turn business requirements into EJB based applications

Java Message Service David A Chappell, Richard Monson-Haefel, 2000-12-04 This book is a thorough introduction to Java Message Service JMS the standard Java application program interface API from Sun Microsystems that supports the formal communication known as messaging between computers in a network JMS provides a common interface to standard messaging protocols and to special messaging services in support of Java programs The messages exchange crucial data between computers rather than between users information such as event notification and service requests Messaging is often used to coordinate programs in dissimilar systems or written in different programming languages Using the JMS interface a programmer can invoke the messaging services of IBM's MQSeries Progress Software's SonicMQ and other popular messaging product vendors In addition JMS supports messages that contain serialized Java objects and messages that contain Extensible Markup Language XML pages Messaging is a powerful new paradigm that makes it easier to uncouple different parts of an enterprise application Messaging clients work by sending messages to a message server which is responsible for delivering the messages to their destination Message delivery is asynchronous meaning that the client can continue working without waiting for the message to be delivered The contents of the message can be anything from a simple text string to a serialized Java object or an XML document Java Message Service shows how to build applications using the point to point and publish and subscribe models how to use features like transactions and durable subscriptions to make an application reliable and how to use messaging within

Enterprise JavaBeans It also introduces a new EJB type the MessageDrivenBean that is part of EJB 2.0 and discusses integration of messaging into J2EE
