Using The Biological Literature Diane Schmidt, Elisabeth B. Davis, 2001-12-06 Provides an in depth review of current print and electronic tools for research in numerous disciplines of biology including dictionaries and encyclopedias method guides handbooks on line directories and periodicals Directs readers to an associated Web page that maintains the URLs and annotations of all major Internet resources discussed in the Immunochemical Protocols. Burns, 2004-12-13 Immunochemical techniques have been in use for many years with early examples of bacterial strain typing dating back to the 1940s The basis for the science is the exquisite elegance of the mammalian immune system with its ability to recognize foreign proteins and to manufacture antibody molecules that strongly bind to the substances that elicited them Not only are potentially harmful pathogens and toxins recognized by the immune system but the system can be persuaded to manufacture antibodies to an astonishing array of substances In the early days of this science all antibodies for investigative work were produced by immunizing mammals with the substance of interest followed by regular donor bleeds that yielded antisera Serum produced in this way yields heterogenic populations of antibody molecules recognizing different epitopes on the target protein which may be adequate for its intended purposes but can also cause problems of crossreactivity In 1975 Kohler and Milstein reported that spleen cells from immune donor animals could be immortalized cloned from single cells

and grown in continuous culture This original work described the method for the production of monoclonal antibodies

Immunochemical Methods in Cell and Molecular Biology, 1987 This book presents up to date immunochemical techniques for isolating and analyzing a wide variety of biological products It collates existing information in one source presenting important basic and applied advances and provides a stimulating forum for the discussion of new ideas and observations on genetically manipulated microbial and viral agents

Immunocytochemical Methods and Protocols Lorette C. Javois, 2008-02-02

The principle that antibodies can be used as cytochemical agents provided they are tagged with suitable markers has been evident for over 50 years During this time the use of immunocytochemical methods has spread to a wide array of biological disciplines Early applications focused on the detection of microbial antigens in tissues while more recent applications have used monoclonal antibodies to study cell differentiation during embryonic development For a select few disciplines volumes have been published focusing on the specific application of immunocytochemical techniques to that discipline What distinguishes the present book Immunocytochemical Methods and Protocols from earlier books is its broad appeal to researchers in all disciplines including those in both research and clinical settings The methods and protocols presented here are designed to be general in their application and the accompanying Notes provide invaluable assistance in adapting or troubleshooting the protocols Interspersed throughout the book are chapters providing overviews of select topics related to immunocytochemistry
