and it has become an active area of research of both theoretical and practical significance This book offers a comprehensive introduction to the phenomena and theories of perceptual learning focusing on the visual domain Perceptual Learning explores the tradeoff between the competing goals of system stability and system adaptability signal and noise retuning and reweighting and top down versus bottom down processes It examines and evaluates existing research and potential future directions including evidence from behavior physiology and brain imaging and existing perceptual learning applications with a focus on important theories and computational models It also compares visual learning to learning in other perceptual domains and considers the application of visual training methods in the development of perceptual expertise and education as well as in remediation for limiting visual conditions It provides an integrated treatment of the subject for students and researchers and for practitioners who want to incorporate perceptual learning into their practice Practice or training in perceptual tasks improves the quality of perceptual performance often by a substantial amount This improvement is called perceptual learning in contrast with learning in the cognitive or motor domains Perceptual learning has been a very active area of research of both theoretical and practical interest Research on perceptual learning is of theoretical significance in illuminating plasticity in adult perceptual systems and in understanding the limitations of human information processing and how to improve them It is of practical significance as a potential method for the development of perceptual expertise in the normal population for its potential in advancing development and supporting healthy aging and for noninvasive amelioration of deficits in challenged populations by training Perceptual learning has become an increasingly important topic in biomedical research Practitioners in this area include science disciplines such as psychology neuroscience computer sciences and optometry and developers in applied areas of learning game design cognitive development and aging and military and biomedical applications Commercial development of training products protocols and games is a multi billion dollar industry Perceptual learning provides the basis for many of the developments in these areas This book is written for anyone who wants to understand the phenomena and theories of perceptual learning or to apply the technology of perceptual learning to the development of training methods and products Our aim is to provide an introduction to those researchers and students just entering this exciting field to provide a comprehensive and integrated treatment of the phenomena and the theories of perceptual learning for active perceptual learning researchers and to describe and develop the basic techniques and principles for readers who want to successfully incorporate perceptual learning into applied developments The book considers the special challenges of perceptual learning that balance the competing goals of system stability and system adaptability It provides a systematic treatment of the major phenomena and models in perceptual learning the determinants of successful learning and of specificity and transfer The book provides a cohesive consideration of the broad range of perceptual learning through the theoretical framework of incremental learning of reweighting evidence that supports successful task performance It provides a detailed analysis of the mechanisms by which perceptual learning improves

perceptual limitations the relationship of perceptual learning and the critical period of development and the semi supervised modes of learning that dominate perceptual learning It considers limitations and constraints on learning multiple tasks and stimuli simultaneously the implications of training at high or low levels of performance accuracy and the importance of feedback to perceptual learning The basis of perceptual learning in physiology is discussed along with the relationship of visual perceptual learning to learning in other sensory domains The book considers the applications of perceptual learning in the development of expertise in education and gaming in training during development and aging and applications to remediation of mental health and vision disorders Finally it applies the phenomena and models of perceptual learning to considerations of optimizing training

Neural Mechanisms of Perceptual Categorization as Precursors to Speech Perception Einat Liebenthal, Lynne E. Bernstein, 2017-05-03 Perceptual categorization is fundamental to the brain s remarkable ability to process large amounts of sensory information and efficiently recognize objects including speech Perceptual categorization is the neural bridge between lower level sensory and higher level language processing A long line of research on the physical properties of the speech signal as determined by the anatomy and physiology of the speech production apparatus has led to descriptions of the acoustic information that is used in speech recognition e g stop consonants place and manner of articulation voice onset time aspiration Recent research has also considered what visual cues are relevant to visual speech recognition i e the visual counter parts used in lipreading or audiovisual speech perception Much of the theoretical work on speech perception was done in the twentieth century without the benefit of neuroimaging technologies and models of neural representation Recent progress in understanding the functional organization of sensory and association cortices based on advances in neuroimaging presents the possibility of achieving a comprehensive and far reaching account of perception in

the service of language At the level of cell assemblies research in animals and humans suggests that neurons in the temporal cortex are important for encoding biological categories On the cellular level different classes of neurons interneurons and pyramidal neurons have been suggested to play differential roles in the neural computations underlying auditory and visual categorization The moment is ripe for a research topic focused on neural mechanisms mediating the emergence of speech representations including auditory visual and even somatosensory based forms Important progress can be achieved by juxtaposing within the same research topic the knowledge that currently exists the identified lacunae and the theories that can support future investigations This research topic provides a snapshot and platform for discussion of current understanding of neural mechanisms underlying the formation of perceptual categories and their relationship to language from a multidisciplinary and multisensory perspective It includes contributions reviews original research methodological developments pertaining to the neural substrates dynamics and mechanisms underlying perceptual categorization and their interaction with neural processes governing speech perception
