Z User Workshop, York 1991 J. E. Nicholls, 2012-12-06 In ordinary mathematics an equation can be written down which is syntactically correct but for which no solution exists For example consider the equation $x \times x = 1$ defined over the real numbers there is no value of x which satisfies it Similarly it is possible to specify objects using the formal specification language Z 3 4 which can not possibly exist Such specifications are called inconsistent and can arise in a number of ways Example 1 The following Z specification of a function f from integers to integers $f : \mathbb{Z} \rightarrow \mathbb{Z}$ $f(x) = 1$ if $x = 1$ $f(x) = 2$ if $x = 2$ is inconsistent because axiom i gives $f(0) = 1$ while axiom ii gives $f(0) = 2$ This contradicts the fact that f was declared as a function that is f must have a unique result when applied to an argument Hence no such f exists Furthermore iff $f(0) = 1$ and $f(0) = 2$ then $1 = 2$ can be deduced From $1 = 2$ anything can be deduced thus showing the danger of an inconsistent specification Note that all examples and proofs start with the word Example or Proof and end with the symbol \square
