Fortran Optimization Apic Studies In Data Processing No 25:

Fortran Optimization Michael Metcalf, 1982 FORTRAN has always been intended to be an efficient high level language and its adherence to this original design aim has helped it to achieve a dominant position in scientific engineering and other areas of computing. However, advice on how to obtain the best possible performance has until now been scattered through the literature in brief articles, detailed reports on specific computers and very general and often superficial chapters in books on FORTRAN programming. This book for the first time deals with the whole topic in a systematic fashion and every effort has been taken to include only the most up to date information and to present it in a way which clearly distinguishes between the different techniques required for the various types of compiler. Primary Audience for the Book: Specialists in numerical computations who are interested in algorithms with automatic result verification. Engineers, scientists and practitioners who desire results with automatic verification and who would therefore benefit from the experience of successful applications. Students in applied mathematics and computer science who want to learn these methods. Goal Of the Book: This book contains surveys of applications of interval computations i.e. applications of numerical methods with automatic result verification that were presented at an international workshop on the subject in El Paso, Texas, February 23-25, 1995. The purpose of this book is to disseminate detailed and surveyed information about existing and potential applications of this new growing field. Brief Description of the Papers: At the most fundamental level, interval

arithmetic operations work with sets The result of a single arithmetic operation is the set of all possible results as the operands range over the domain For example $0.9 \pm 1.1 \pm 2.9 \pm 3.1 \pm 3.8 \pm 4.2$ where $3.8 \pm 4.2 \times y$ $y \in [0.9, 1.1]$ and $y \in [3.8, 4.2]$ The power of interval arithmetic comes from the fact that i the elementary operations and standard functions can be computed for intervals with formulas and subroutines and ii directed roundings can be used so that the images of these operations e g
