Weisstein, 2002-12-12 Upon publication the first edition of the CRC Concise Encyclopedia of Mathematics received overwhelming accolades for its unparalleled scope readability and utility It soon took its place among the top selling books in the history of Chapman Hall CRC and its popularity continues unabated Yet also unabated has been the demand for a **Mathematical Handbook for Scientists and Engineers** Granino A. Dynamical Systems on 2- and 3-Manifolds Viacheslav Z. Grines, Timur V. Medvedev, Olga V. Pochinka, 2016-11-11 This book provides an introduction to the topological classification of smooth structurally stable diffeomorphisms on closed orientable 2 and 3 manifolds The topological classification is one of the main problems of the theory of dynamical systems and the results presented in this book are mostly for dynamical systems satisfying Smale's Axiom A The main results on the topological classification of discrete dynamical systems are widely scattered among many papers and surveys This book presents these results fluidly systematically and for the first time in one publication Additionally this book discusses the recent results on the topological classification of Axiom A diffeomorphisms focusing on the nontrivial effects of the dynamical systems on 2 and 3 manifolds The classical methods and approaches which are considered to be promising for the further research are also discussed by The reader needs to be familiar with the basic concepts of the qualitative theory of dynamical systems which are presented in Part 1 for convenience The book is accessible to ambitious undergraduates graduates and researchers in dynamical systems and low dimensional topology This volume consists of 10 chapters each chapter contains its own set of references and a section on further reading Proofs are presented with the exact statements of the results In Chapter 10 the authors briefly state the necessary definitions and results from algebra geometry and topology When stating ancillary results at the beginning of each part the authors refer to other sources which are readily available

[The Poincaré Conjecture](#) Donal O'Shea, 2009-05-26 Henri Poincaré was one of the greatest mathematicians of the late nineteenth and early twentieth century He revolutionized the field of topology which studies properties of geometric configurations that are unchanged by stretching or twisting The Poincaré conjecture lies at the heart of modern geometry and topology and even pertains to the possible shape of the universe The conjecture states that there is only one shape possible for a finite universe in which every loop can be contracted to a single point Poincaré's conjecture is one of the seven millennium problems that bring a one million dollar award for a solution Grigory Perelman a Russian mathematician has offered a proof that is likely to win the Fields Medal the mathematical equivalent of a Nobel prize in August 2006 He also will almost certainly share a Clay Institute millennium award In telling the vibrant story of The Poincaré Conjecture Donal O'Shea makes accessible to general readers for the first time the meaning of the conjecture and brings alive the field of mathematics and the achievements of generations of mathematicians whose work have led to Perelman's proof of this famous conjecture

NRL Report, *Foundations of Set Theory* A.A. Fraenkel, Y. Bar-Hillel, A. Levy, 1973-12-01 Foundations of Set

Theory discusses the reconstruction undergone by set theory in the hands of Brouwer Russell and Zermelo Only in the axiomatic foundations however have there been such extensive almost revolutionary developments This book tries to avoid a detailed discussion of those topics which would have required heavy technical machinery while describing the major results obtained in their treatment if these results could be stated in relatively non technical terms This book comprises five chapters and begins with a discussion of the antinomies that led to the reconstruction of set theory as it was known before It then moves to the axiomatic foundations of set theory including a discussion of the basic notions of equality and extensionality and axioms of comprehension and infinity The next chapters discuss type theoretical approaches including the ideal calculus the theory of types and Quine s mathematical logic and new foundations intuitionistic conceptions of mathematics and its constructive character and metamathematical and semantical approaches such as the Hilbert program This book will be of interest to mathematicians logicians and statisticians

The Classes of Higher Dimensional Polytopes in Chemical, Physical, and Biological Systems Zhizhin, Gennadiy Vladimirovich, 2022-04-08 The study of the geometry of structures that arise in a variety of specific natural systems such as chemical physical biological and geological revealed the existence of a wide range of types of polytopes of the highest dimension that were unknown in classical geometry At the same time new properties of polytopes were discovered as well as the geometric patterns to which they obey There is a need to classify these types of polytopes of the highest dimension by listing their properties and formulating the laws to which they obey The Classes of Higher Dimensional Polytopes in Chemical Physical and Biological Systems explains the meaning of higher dimensions and systematically generalizes the results of geometric research in various fields of knowledge This book is useful both for the fundamental development of geometry and for the development of branches of science related to human activities It builds upon previous books published by the author on this topic Covering areas such as heredity geometry and dimensions this reference work is ideal for researchers scholars academicians practitioners industry professionals instructors and students

Topics in Mathematical Analysis and Differential Geometry Nicolas K. Laos, 1998 This book studies the interplay between mathematical analysis and differential geometry as well as the foundations of these two fields The development of a unified approach to topological vector spaces differential geometry and algebraic and differential topology of function manifolds led to the broad expansion of global analysis This book serves as a self contained reference on both the prerequisites for further study and the recent research results which have played a decisive role in the advancement of global analysis

Geometrical Combinatorial Topology Leslie C. Glaser, 1970 The following lecture notes are intended to give a self contained exposition of the foundations of geometrical combinatorial piecewise linear topology starting with the rudiments of the theory and then continuing on to some of the more recent research papers in the area those which are still quite basic and emphasize the geometrical aspect of combinatorial topology An attempt has been made to develop the fundamental ideas and techniques quite carefully and completely The reader is

only required to have an elementary knowledge of point set topology and a familiarity with some of the standard theorems in algebraic topology and of course sufficient mathematical maturity
