National Library of Medicine Current Catalog National Library of Medicine (U.S.),1983 Insecticide Action J.E. Chambers,T. Narahashi,2012-12-06 Intoxication of humans and animals has become increasingly important in recent years as has contamination of the environment by a variety of chemicals In order to develop effective means by which such intoxication and contamination can be properly handled it is imperative to know how these environmental agents act in humans and animals Despite studies conducted by various investigators the mechanisms of action of these environmental agents have not been fully elucidated Insecticides are by no means an exception in terms of the seriousness of the problem and of the urgency of the need for such information In order to complete a picture of the effects of any particular insecticide it is of utmost importance that its actions at various levels ranging from those of molecules to whole animals be analyzed and synthesized To understand the toxicological action on animals or humans it is not sufficient to know the action at each level only The actions at various levels must be integrated to construct a picture of the toxic effect on the intact organism However in spite of the large body of information that has been accumulated during the past few decades little or no attempt has been made to integrate experimental data obtained at the molecular cellular organ and animal levels together in order to define the whole picture of insecticidal action

Recent Advances in Nervous System Toxicology Corrado L. Galli, Luigi Manzo, Peter S. Spencer, 2012-12-06 This volume addresses some facets of the adverse actions of chemical agents on the central and peripheral nervous systems in developing and mature states Some of the effects of these chemicals are short lasting and rapidly reversible others especially those that cause structural damage to the nervous system may result in permanent damage to the organism The nervous system has several levels of vulnerability to toxic substances Some substances perturb ion channels or synaptic mechanisms required for the orderly transfer of electrochemical information within the nervous system Others disrupt sites required for the maintenance of cellular integrity and these variably result in degenerative responses of neurons and myelinating cells Further sites of vulnerability include the delicate neural vasculature and neurohumeral mechanisms responsible for physiological homeostasis The science of neurotoxicology inevitably is a multidisciplinary endeavor with contributions from biochemistry physiology morphology and behavior to name a few The challenge is to apply appropriate techniques to investigate neurotoxic phenomena The first logical step in this analysis is to determine from the point of view of the nervous system the nature of the exposure Is the chemical a single or multiple entity is it metabolized how does it gain access to neural tissue Once these factors are understood changes induced by the exposure can be described at various levels from the biochemical to the behavioral Review of the Administration's Pesticide Reform Proposal United States.
