Greenlee,1982 Energy Conversion Ideal vs Real Operation Technical Background Engineering Software, The simple and basic power cycles Brayton Cycle Otto Cycle and Diesel Cycle power cycle components processes compression combustion and expansion and compressible flow components nozzle diffuser and thrust are presented in this technical background material In the presented power cycles power cycle components process and compressible flow components analysis air is used as the working fluid For each power cycle the thermal efficiency derivation is presented with a simple mathematical approach Also for each power cycle a T s diagram and cycle major performance trends thermal efficiency specific power output and power output are plotted in a few figures as a function of compression ratio turbine inlet temperature and or final combustion temperature working fluid mass flow rate and both isentropic compression and expansion efficiency It should be

noted that this course material does not deal with costs capital operational or maintenance For compression and expansion the technical performance of mentioned power cycle components processes for ideal and real operation is presented with a given relationship between pressure and temperature and compression and expansion efficiency Complete combustion at constant pressure with and without heat loss is presented Six different fuels carbon hydrogen sulfur coal oil and gas react with air as the oxidant at different stoichiometry values stoichiometry 1 and oxidant inlet temperature values Reactants and combustion products enthalpy values change with an increase in the temperature and such enthalpy values are presented in a plot where one can notice fuel higher heating value HHV and flame temperature definitions Physical properties of basic combustion reactants and products are presented in an enthalpy vs temperature plot The combustion technical performance at stoichiometry 1 conditions is presented knowing the enthalpy values for combustion reactants and products given as a function of temperature Combustion products composition on both weight and mole basis is given in tabular form and plotted in a few figures Also flame temperature oxidant to fuel ratio and fuel higher heating value HHV are presented in tabular form and plotted in a few figures The provided output data and plots allow one to determine the major combustion performance laws and trends The technical performance of compressible flow components subsonic nozzle diffuser and thrust is presented with a given relationship between temperature and pressure as a function of the Mach Number and isentropic nozzle and diffuser efficiency The compressible flow components T s diagrams and their major performance trends stagnation over static temperature and pressure ratio values are plotted in a few figures as a function of the Mach Number In this technical background material one gets familiar with the simple and basic power cycles and power cycle components processes compressible flow components and their T s and h T diagrams ideal vs real operation and major performance trends

Marris, 1998-10-25 An updated revisiting of the themes of Robin Marris classic The Economic Theory of Managerial Capitalism 1964 This was widely recognised as pathbreaking as it was the first attempt by a professional economist to make a formal theory of the behaviour and growth of a large scale managerial corporation based on a realistic assessment of the sociological and institutional environment The model determined the long run growth rates of individual firms on the basis of the financial and market environment on the one hand and the needs interest and aspirations of both managers and shareholders on the other Managers in particular were shown to trade desire for growth against fear of takeover These then novel important features

of modern capitalism mergers takeovers and executive bonuses and the relationship between the growth of firms and the growth of the economy have become increasingly topical The book contains the original introduction along with reworked and updated coverage of the theoretical model along with completely new chapters both of micro theory and Marris substantive response to the debate which the original book created     **Energy Efficiency** United States.
