beginning of a dynamic economic and stock market upswing in the U S in the mid 1990s marked the start of a new era the times of the new economy This phenomenon has been under intense discussion ever since both in the political arena as well as among scientists Thereby the somewhat glamorous term new economy reflects the conviction held by its proponents that the use of new technologies will lead to a never ending acceleration of technological progress and economic welfare The origins of this development date back a long time More than 30 years ago the starting point was the basic innovation digitilization Production as well as application of information and communications technologies ICT are based on this principle At the beginning of the seventies the first microprocessor was produced Some ten years later the first personal computer was brought onto the market The commercial use of the Internet has begun in the mid nineties In view of the economic boom in the U S accompanying the introduction of the Internet the question arises as to what extent the new economy actually has exerted lasting positive effects on productivity not only in the United States but also worldwide Inspired by these developments the Federal Ministry of Economics and Technology commissioned RWI Essen to study the driving forces of the new economy In this report the trends of the ICT sector and of the use of ICT products are analyzed with respect to the overall economic effects in Germany in comparison to the U S Further analyses were carried out regarding the intensity and effects of e business Finally the influence of different methods of price measurement on productivity was analysed since this is important for international comparisons of total factor productivity The study culminates in a growth accounting calculation separating the contributions to economic growth by capital labor and technological progress
