Kinetic Theory of Living Pattern Lionel G. Harrison,2005 *Kinetic Theory of Living Pattern* Lionel G.

Harrison,2005-09-15 Discusses the development of the shapes of living organisms and their parts in a field of science in which there are no generally accepted theoretical principles **Understanding Ageing** Robin Holliday,1995-01-27 This book presents a completely novel approach to the understanding of ageing which many believe is an unsolved problem in biology It explains why ageing exists in animals and reviews our understanding of it at the biological level This includes a discussion of the origins and evolution of ageing The book is not a review of research on ageing but instead draws on material from a wide range of disciplines including the very extensive biomedical information about age related diseases in humans Understanding Ageing argues that much research needs to be done on the cellular and molecular aspects of ageing if the origins of these diseases are to be understood and their prevention made possible This thought provoking book will appeal to all students and researchers who are interested in ageing whether they are working in the clinical or basic research sphere **Volvox** David L. Kirk,1998 This book reviews Volvox development and biology and through this study sheds light on the origins of multicellularity **Dictyostelium** Richard H. Kessin,2001-01-11 Dictyostelia are soil amoebae capable of extraordinary feats of survival motility chemotaxis and development Characterised by their ability to transform from a single celled organism into an elaborate assemblage of thousands of synchronously moving cells Dictyostelids are often referred to as social amoebae and have been the subjects of serious study since the 1930s Research in this area has been instrumental in understanding many problems in cellular biology Beginning with the history of Dictyostelids and discussing each stage of their development this book considers the evolution of this unique organism analyses the special properties of the Dictyostelid genome and presents in detail the methods available at the time of the book's original publication in 2001 to manipulate their genes Representing the synthesis of such material and with an emphasis on combining classical experiments with modern molecular findings this book will be essential for researchers and graduates in developmental and cellular biology Limb Regeneration Panagiotis A. Tsonis,1996-07-13 This is the first book that analyses the mechanisms of limb regeneration by incorporating the information obtained from older experiments with the many new recent advances in molecular and cellular biology **Fungal Morphogenesis** David Moore,1998 Fungal Morphogenesis brings together for the first time the full scope of fungal developmental biology **Gravity and the Behavior of Unicellular Organisms** Donat-Peter Häder,Ruth Hemmersbach,Michael Lebert,2005-01-17 Unicellular organisms use gravity as an environmental guide to reach and stay in regions optimal for their growth and reproduction These single cells play a significant role in food webs and these factors together make the effects of gravity on unicellular organisms a fascinating and important subject for scientific study In addition they present valuable model systems for studying the mechanisms of gravity perception a topic of increasing interest in these days of experimentation in space This

book reveals how single cells achieve the same sensoric capacity as multicellular organisms like plants or animals It reviews the field discussing the historical background ecological significance and related physiology of unicellular organisms as well as various experimental techniques and models with which to study them Those working on the biology of unicellular organisms as well as in related areas of gravitational and space science will find this book of value Hormones, Signals and Target Cells in Plant Development Daphne J. Osborne, Michael T. McManus, 2005-04-11 Meristematic cells in plants become the many different types of cells found in a mature plant This is achieved by a selective response to chemical signals both from neighbouring cells and distant tissues It is these responses that shape the plant its time of flowering the sex of its flowers its length of survival or progress to senescence and death How do plants achieve this This treatise addresses this question using well chosen examples to illustrate the concept of target cells The authors discuss how each cell has the ability to discriminate between different chemical signals determining which it will respond to and which it will ignore The regulation of gene expression through signal perception and signal transduction is at the core of this selectivity and the Target Cell concept This volume will serve as a valuable reference for all researchers working in the field of plant developmental biology **Cytokinesis in Animal Cells** R. Rappaport, 1996-10-28 This book traces the history of the major ideas and gives an account of our current knowledge of cytokinesis Modelling the Dynamics of Biological Systems Erik Mosekilde, Ole G. Mouritsen, 2012-12-06 The development of a proper description of the living world today stands as one of the most significant challenges to physics A variety of new experimental techniques in molecular biology microbiology physiology and other fields of biological research constantly expand our knowledge and enable us to make increasingly more detailed functional and structural descriptions Over the past decades the amount and complexity of available information have multiplied dramatically while at the same time our basic understanding of the nature of regulation behavior morphogenesis and evolution in the living world has made only modest progress A key obstacle is clearly the proper handling of the available data This requires a stronger emphasis on mathematical modeling through which the consistency of the adopted explanations can be checked and general principles may be extracted As an even more serious problem however it appears that the proper physical concepts for the development of a theoretically oriented biology have not hitherto been available Classical mechanics and equilibrium thermodynamics for instance are inappropriate and useless in some of the most essential biological contexts Fortunately there is now convincing evidence that the concepts and methods of the newly developed fields of nonlinear dynamics and complex systems theory combined with irreversible thermodynamics and far from equilibrium statistical mechanics will enable us to move ahead with many of these problems The Neural Crest Nicole Le Douarin, Chaya Kalcheim, 1999-11-28 This 1999 edition of The Neural Crest contains comprehensive information about the neural crest a structure unique to the vertebrate embryo which has only a transient existence in early embryonic life The ontogeny of the neural crest embodies the most important issues in developmental biology as the neural crest is

considered to have played a crucial role in evolution of the vertebrate phylum Data that analyse neural crest ontogeny in murine and zebrafish embryos have been included in this revision This revised edition also takes advantage of recent advances in our understanding of markers of neural crest cell subpopulations and a full chapter is now devoted to cell lineage analysis The major research breakthrough since the first edition has been the introduction of molecular biology to neural crest research enabling an elucidation of many molecular mechanisms of neural crest development This book is essential reading for students and researchers in developmental biology cell biology and neuroscience **Philosophical**

Transactions of the Royal Society of London ,2000 Each issue of Transactions B is devoted to a specific area of the biological sciences including clinical science All papers are peer reviewed and edited to the highest standards Published on the 29th of each month Transactions B is essential reading for all biologists *Quirks of Human Anatomy* Lewis I. Held,2009-05-29 This book introduces students to basic concepts in evolutionary developmental biology for undergraduate and graduate courses **Functional Tissue Engineering** Farshid Guilak,David L. Butler,Steven A. Goldstein,David

Mooney,2006-04-20 Softcover reprint of a successful hardcover reference 370 copies sold Price to be accessible to the rapidly increasing population of students and investigators in the field of tissue engineering Chapters written by well known researchers discuss issues in functional tissue engineering as well as provide guidelines and a summary of the current state of technology *Function and Regulation of Cellular Systems* Andreas Deutsch,Jonathan Howard,Martin Falcke,Walter Zimmermann,2012-12-06 Current biological research demands the extensive use of sophisticated mathematical methods and computer aided analysis of experiments and data This highly interdisciplinary volume focuses on structural dynamical and functional aspects of cellular systems and presents corresponding experiments and mathematical models The book may serve as an introduction for biologists mathematicians and physicists to key questions in cellular systems which can be studied with mathematical models Recent model approaches are presented with applications in cellular metabolism intra and intercellular signaling cellular mechanics network dynamics and pattern formation In addition applied issues such as tumor cell growth dynamics of the immune system and biotechnology are included American Journal of Botany ,1999 **American Book**

Publishing Record ,2005 *Pattern formation in biology* Luis Diambra,Pau Formosa-Jordan,David M. Holloway,2023-06-07

Sixty Years of Biology John Tyler Bonner,2017-03-14 John Tyler Bonner a major participant in the development of biology as an experimental science is the author not only of important monographs but also of a wonderfully readable book *Life Cycles* which is both a personal memoir and a profound commentary on the central themes of biology This volume of essays presents new material that extends the concepts from *Life Cycles* and his other writings Its originality lies in comparing key basic biological processes at different levels from molecular interactions through multicellular development to behavior and social interactions The first chapter in the book discusses self organization and natural selection the second competition and natural selection and the third gene accumulation and gene silencing The fourth chapter examines the division of labor in

organisms at all levels within the organelles of a cell within groups of cells in the guise of differentiation within groups of individuals in an animal society and within our culturally determined human societies The work closes with a charming personal history of sixty years of changes in the field of biology including the transformation in the ways that research work is funded Originally published in 1996 The Princeton Legacy Library uses the latest print on demand technology to again make available previously out of print books from the distinguished backlist of Princeton University Press These editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions The goal of the Princeton Legacy Library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by Princeton University Press since its founding in 1905
