Long Term Durability of Structural Materials P.J.M. Monteiro,K.P. Chong,J. Larsen-Basse,K. Komvopoulos,2001-08-29 Long Term Durability of Structural Materials features proceedings of the workshop held at Berkeley CA in October 2000 It brought together engineers and scientists who have received grants from the initiative NSF 98 42 to share their results on the study of long term durability of materials and structures The major objective was to develop new methods for accelerated short term laboratory or in situ tests which allow accurate reliable predictions of the long term performance of materials machines and structures To achieve this goal it was important to understand the fundamental nature of the deterioration and damage processes in materials and to develop innovative ways to model the behavior of these processes as they affect the life and long term performance of components machines and structures The researchers discussed their approach to include size effects in scaling up from laboratory specimens to actual structures Accelerated testing and durability modeling techniques developed were validated by comparing their results with performance under actual operating conditions The main mechanism of the deterioration discussed included environmental effects and or exposure to loads speeds and other operating conditions that are not fully anticipated in the original design A broad range of deterioration damage such as fatigue overload ultraviolet damage corrosion and wear was presented A broad range of materials of interest was also discussed including the full spectrum of construction materials metals ceramics polymers composites and coatings Emphasis was placed on scale dependence and history of fabrication on resulting mechanical behavior of materials

Behaviour and the Fracture Pattern Morphology of Tempered Soda-Lime Glass Navid Pour-Moghaddam,2019-11-08

The main criteria for assessing the load bearing behaviour and risk potential of monolithic glass are its fragmentation and the morphology of the fragments These depend strongly non linearly on the strain energy density present in the glass at the time of fracture which can be converted into fracture energy Thus the design and optimization of structural glazing in engineering requires both knowledge of the relevant parameters and mechanisms during the fracture process in glass and an understanding of the characteristics of the fracture structure Based on fracture mechanics considerations and comprehensive experimental investigations various aspects and physical quantities of fracture behaviour as well as characteristics and parameters of fracture pattern morphology of fragmented tempered soda lime glass were studied and correlated with the stored strain energy The relationship between fragmentation behavior and strain energy was elaborated using the energy criterion in Linear Elastic Fracture Mechanics LEFM related to the initial strain energy before fragmentation and in the post fracture state Furthermore a machine learning inspired approach for the prediction of 2D macro scale fragmentation of tempered glass was developed and elaborated based on fracture mechanics considerations and statistical analysis of the fracture pattern morphology A method was deduced and applied in which the fracture pattern of tempered glass is predicted and simulated by Voronoi tessellation of point patterns based on Bayesian spatial point statistics fed with energy conditions in LEFM *Fractures in Knapping* Are Tsirk,2014-11-17 This book is for students and
