R. Seshadri, 2000 The objective of this paper was to analyze the crack linkup behavior in riveted lap splice joint panels with small multiple site damage MSD cracks at several adjacent rivet holes Analyses are based on the STAGS STructural Analysis of General Shells code with the critical crack tip opening angle CTOA fracture criterion To account for high constraint around a crack front the plane strain core option in STAGS was used The importance of modelling rivet flexibility with fastener elements that accurately model load transfer across the joint is discussed Fastener holes are not modeled but rivet connectivity is accounted for by attaching rivets to the sheet on one side of the cracks that simulated both the rivet diameter and MSD cracks Residual strength analyses made on 2024 T3 alloy 1 6 mm thick riveted lap splice joints with a lead crack and various size MSD cracks were compared with test data from Boeing Airplane Company Analyses were conducted for both restrained and unrestrained buckling conditions Comparison of results from these analyses and results from lap splice joint test panels which were partially restrained against buckling indicate that the test results were bounded by the failure loads predicted by the analyses with restrained and unrestrained conditions
