Fracture Mechanics of Ceramics R. C. Bradt, A. G. Evans, D. P. H. Hasselman, F. F. Lange, 2012-12-06 These volumes 7 and 8 of Fracture Mechanics of Ceramics constitute the proceedings of an international symposium on the fracture mechanics of ceramic materials held at Virginia Polytechnic Institute and State University Blacksburg Virginia on June 19 20 and 21 1985 These proceedings constitute the fourth pair of volumes of a continuing series of conferences The theme of this conference as the previous three focused on the mechanical behavior of ceramic materials in terms of the characteristics of cracks particularly the roles which they assume in the fracture process The 78 contributed papers by over 100 authors and co authors represent the current state of the field They address many of the theoretical and practical problems of interest to those concerned with brittle fracture The program chairmen gratefully acknowledge the financial assistance for the Symposium provided by the EXXON Foundation the Army Research Office the National Science Foundation and the Office of Naval Research Without their support this conference simply would not have been possible The suggestions of Drs J C Hurt R C Pohanka and L Toth were particularly helpful in assuring the success of this symposium Special appreciation is extended to Professor J I Robertson C P Miles Professor of History whose presentation following the banquet on the American Civil War was very well received by the audience Finally we wish to also thank our joint secretaries especially Karen Snider for their patience and help in finally bringing these proceedings to press *Fracture Mechanics of Ceramics* Richard Carl

Volume 8. Microstructure, Methods, Design, and Fatigue R. C. Bradt, A. G. Evans, D. P. Hasselman, F. F.

Lange, WASHINGTON UNIV SEATTLE COLL OF ENGINEERING., 1986 The influence of microstructure on defects in ceramics and the consequences of their presence for the application of fracture mechanics theories are reviewed The complexities of microstructures especially the multiphase nature the crystallographic anisotropy and the resultant anisotropic physical properties and the variation of microstructure and surface finish from point to point in real components all lead to considerable uncertainties in the actual performance of any particular component It is concluded that although the concepts of fracture mechanics have been and will continue to be most useful for the quantitative explanation of fracture phenomena the usefulness as a predictive tool with respect to most existing types of material is limited by the interrelation between material microstructure and mechanical properties At present the only method of eliminating components with unsatisfactory mechanical properties is to proof test them despite the fact that proof testing itself is limited in ability to cope with changes to the component in service The aim of the manufacturer must be to improve quality and consistency within individual components from component to component and from batch to batch The aim of the fracture specialist must be to study longer term properties to improve the accuracy of behaviour predictions with a stronger data base Materials development needs to concentrate on obtaining defect free materials that can be translated into more reliable products using our present understanding of the influence of microstructure on strength and toughness
