Industrial Image Processing Christian Demant, Bernd Streicher-Abel, Peter Waszkewitz, 2012-12-06 Digital image processing has become a key technology in the area of manufacturing and quality control Increasing quality demands require inspection of every single part which in turn will lead to a much more widespread use of automatic visual inspection systems in the near future Furthermore the documentation requirements of ISO 9000 and similar quality control standards can only be met by fully automated networked inspection systems On the other hand despite a multitude of successful applications digital image processing has not yet established itself as an accepted element of manufacturing technology This holds true for the industrial practice as well as for the training of engineers Digital image processing is still widely regarded as some kind of secret lore mastered only by a small number of expensive experts This impression of incomprehensibility frequently leads to the accusation of unreliability The manufacturers of digital image processing systems in the industry are not least responsible for this state of affairs due to their policy of giving the customer as little information as possible about the methods and technology used to inspect his products

many years on the state of the art in remote control of and data acquisition from astronomical telescopes *Lock-in Thermography* Otwin Breitenstein, Wilhelm Warta, Martin Langenkamp, 2013-03-09 Although the first publication on lock in thermography appeared in 1988 concerning electronic device testing this technique only became popular in the 1990s in connection with the nondestructive testing of materials NDT especially photothermal and thermoelastic investigations In the early 1990s our group at the Max Planck Institute of Microstructure Physics in Halle had the task to image small leakage currents in silicon solar cells We soon realized that neither conventional steady state thermography nor the only available lock in thermography system of that time was sensitive enough to image the tiny temperature differences caused by these leakage currents Therefore we developed the Dynamic Precision Contact Thermography technique DPCT which was the first lock in thermography system having a detection limit below 100 J LK However this system turned out to be too impracticable for general use since it worked in a mechanical contacting mode and its measurement time was necessarily many hours With the availability of highly sensitive focal plane array thermocameras at the end of the 1990s the way was opened to construct highly sensitive IR based lock in thermography systems This was done independently by groups working in NDT and by us working in electronic device testing whereby the different demands in the different fields lead to partly different approaches in the realization For photothermal investigations a low lock in frequency is usually used in order to see sub surface details and for thermoelastic investigations the thermo camera cannot usually be synchronized to the temperature modulation
