Graph Data-Models and Semantic Web Technologies in Scholarly Digital Editing Elena Spadini, Francesca Tomasi, Georg Vogeler, 2021-10-06 In scholarly digital editing the established practice for semantically enriching digital texts is to add markup to a linear string of characters Graph data models provide an alternative approach which is increasingly being given serious consideration Labelled property graph databases and the W3c s semantic web recommendation and associated standards RDF and OWL are powerful and flexible solutions to many of the problems that come with embedded markup This volume explores the combination of scholarly digital editions the graph data model and the semantic web from three perspectives infrastructures and technologies formal models and projects and editions **RDF Database Systems** Olivier Curé, Guillaume Blin, 2014-11-24 RDF Database Systems is a cutting edge guide that distills everything you need to know to effectively use or design an RDF database This book starts with the basics of linked open data and covers the most recent research practice and technologies to help you leverage semantic technology With an approach that combines technical detail with theoretical background this book shows how to design and develop semantic web applications data models indexing and query processing solutions Understand the Semantic Web RDF RDFS SPARQL and OWL within the context of relational database management and NoSQL systems Learn about the prevailing RDF triples solutions for both relational and non relational databases including column family document graph and NoSQL Implement systems using RDF data with helpful guidelines and various storage solutions for RDF Process SPARQL queries with detailed explanations of query optimization query plans caching and more Evaluate which approaches and systems to use when developing Semantic Web applications with a helpful description of commercial and open source systems *Graph Algorithms in the Language of Linear Algebra* Jeremy Kepner, John Gilbert, 2011-01-01 The current exponential growth in graph data has forced a shift to parallel computing for executing graph algorithms Implementing parallel graph algorithms and achieving good parallel performance have proven difficult This book addresses these challenges by exploiting the well known duality between a canonical representation of graphs as abstract collections of vertices and edges and a sparse adjacency matrix representation This linear algebraic approach is widely accessible to scientists and engineers who may not be formally trained in computer science The authors show how to leverage existing parallel matrix computation techniques and the large amount of software infrastructure that exists for these computations to implement efficient and scalable parallel graph algorithms The benefits of this approach are reduced algorithmic complexity ease of implementation and improved performance *Coordination Models and Languages* Tom Holvoet, Mirko Viroli, 2015-04-29 This book constitutes the refereed proceedings of the 17th International Conference on Coordination Models and Languages COORDINATION 2015 held as part of the 10th International Federated Conference on Distributed Computing Techniques DisCoTec 2015 in Grenoble France in June 2015 The 14 full papers and one short paper presented were carefully reviewed and selected from 36 submissions They are
