Wulf,2012-12-06 Current practice dictates the separation of the hardware and software development paths early in the design cycle These paths remain independent with very little interaction occurring between them until system integration In particular hardware is often specified without fully appreciating the computational requirements of the software Also software development does not influence hardware development and does not track changes made during the hardware design phase Thus the ability to explore hardware software tradeoffs is restricted such as the movement of functionality from the software domain to the hardware domain and vice versa or the modification of the hardware software interface As a result problems that are

encountered during system integration may require modification of the software and or hardware resulting in potentially significant cost increases and schedule overruns To address the problems described above a cooperative design approach one that utilizes a unified view of hardware and software is described This approach is called hardware software codesign The Codesign of Embedded Systems develops several fundamental hardware software codesign concepts and a methodology that supports them A unified representation referred to as a decomposition graph is presented which can be used to describe hardware or software using either functional abstractions or data abstractions Using a unified representation based on functional abstractions an abstract hardware software model has been implemented in a common simulation environment called ADEPT Advanced Design Environment Prototyping Tool This model permits early hardware software evaluation and tradeoff exploration Techniques have been developed which support the identification of software bottlenecks and the evaluation of design alternatives with respect to multiple metrics The application of the model is demonstrated on several examples A unified representation based on data abstractions is also explored This work leads to investigations regarding the application of object oriented techniques to hardware design The Codesign of Embedded Systems A Unified Hardware Software Representation describes a novel approach to a topic of immense importance to CAD researchers and designers alike

Object-Oriented Modeling Jean-Michel Bergé, Oz Levia, Jacques Rouillard, 2012-12-06 Object oriented techniques and languages have been proven to significantly increase engineering efficiency in software development Many benefits are expected from their introduction into electronic modeling Among them are better support for model reusability and flexibility more efficient system modeling and more possibilities in design space exploration and prototyping Object Oriented Modeling explores the latest techniques in object oriented methods formalisms and hardware description language extensions The seven chapters comprising this book provide an overview of the latest object oriented techniques for designing systems and hardware Many examples are given in C VHDL and real time programming languages Object Oriented Modeling describes further the use of object oriented techniques in applications such as embedded systems telecommunications and real time systems using the very latest techniques in object oriented modeling It is an essential guide to researchers practitioners and students involved in software hardware and system design

**A Concurrent Object-oriented Approach for Requirements Analysis and Design of Embedded Systems** Vikul Khosla, 1991

**Specification and Design of Embedded Systems** Daniel D. Gajski, 1994 This is the first book on embedded systems to offer a unified approach to hardware and software specification and design issues and the first to

outline a new specify explore refine paradigm that is presently being used in industry in an ad hoc manner but until now has not been formally described The book addresses the system design methodology from conceptualization to manufacturing using this new paradigm and shows how this methodology can result in 10x improvement in productivity Addresses two of the most significant topics in the design of digital systems executable system specification and a methodology for system partitioning and refinement into system level components Covers models and architectures specification languages a specification example translation to VHDL system partitioning design quality estimation specification refinement into synthesizable models and system design methodology and environment Contains a complete specification of a model product telephone answering machine and demonstrates how to write the specification from an English description For RISC design methodologists and VHDL methodologists and CAD software developers

**Embedded Systems Design Based on Formal Models of Computation** Ivan Radojevic,Zoran Salcic,2011-06-15 Models of Computation for Heterogeneous Embedded Systems presents a model of computation for heterogeneous embedded systems called DFCharts It targets heterogeneous systems by combining finite state machines FSM with synchronous dataflow graphs SDFG FSMs are connected in the same way as in Argos a Statecharts variant with purely synchronous semantics using three operators synchronous parallel refinement and hiding The fourth operator called asynchronous parallel is introduced in DFCharts to connect FSMs with SDFGs In the formal semantics of DFCharts the operation of an SDFG is represented as an FSM Using this representation SDFGs are merged with FSMs so that the behaviour of a complete DFCharts specification can be expressed as a single flat FSM This allows system properties to be verified globally The practical application of DFCharts has been demonstrated by linking it to widely used system level languages Java Esterel and SystemC

**Embedded System Development Process** Roger Hu,2020-02-13 It is the megatrend in today s digital connected world each and every personal gadget from palmtop smart cellular game set top box to wearable devices is getting thinner lighter shorter smaller and of course low power The global competition and shorter product life cycle post a major challenge to the product development It is getting harder to meet customer s demands on time because customers want the products to be done as early as possible The reason is simple competitions are so high and the technology advances are so fast Because the time to market is very short for a new product introduction the development of a new product is often started too hastily no development plan do not follow the golden process flow no thorough reviews incomplete test cases waive bugs etc so engineers and developers have to repeat what they have done to fix things in the end everything takes much longer than it should be A good design flow can reduce time to market meanwhile improve product s quality Software development is usually questionable for its poor quality and unreliability Buggy code improper interfaces and missing features are almost encountered by the users of most embedded system The embedded system developers are filled with consequence of missed deadlines and huge cost overruns Embedded system developers can benefit from high quality design flow by identifying optimal product architecture and executing a high

quality design process Embedded software development tools are also vitally important for productive development and keeping development in control The purpose of writing this software design process flow is to ensure that by following a high quality process and right set of development tools the developers shall possess the highest quality of products while maintaining a competitive schedule and a lower cost structure
