## Geometry II:

*geometry ii* Marcel Berger, 1987      Geometry II E.B. Vinberg, 2013-04-17 Spaces of constant curvature i.e. Euclidean space the sphere and Lobachevskij space occupy a special place in geometry They are most accessible to our geometric intuition making it possible to develop elementary geometry in a way very similar to that used to create the geometry we learned at school However since its basic notions can be interpreted in different ways this geometry can be applied to objects other than the conventional physical space the original source of our geometric intuition Euclidean geometry has for a long time been deeply rooted in the human mind The same is true of spherical geometry since a sphere can naturally be embedded into a Euclidean space Lobachevskij geometry which in the first fifty years after its discovery had been regarded only as a logically feasible by-product appearing in the investigation of the foundations of geometry has even now despite the fact that it has found its use in numerous applications preserved a kind of exotic and even romantic element This may probably be explained by the permanent cultural and historical impact which the proof of the independence of the Fifth Postulate had on human thought      **General Catalog** University of Missouri, 1873      Catalogue of the University of Michigan University of Michigan, 1967 Announcements for the following year included in some vols      General Register University of Michigan, 1908 Announcements for the following year included in some vols      **A Subject With No Object** John P. Burgess, Gideon Rosen, 1997-01-16 Numbers and other mathematical objects are exceptional in having no locations in space or time or relations of cause and effect This makes it difficult to account for the possibility of the knowledge of such objects leading many philosophers to embrace nominalism the doctrine that there are no such objects and to embark on ambitious projects for interpreting mathematics so as to preserve the subject while eliminating its objects A Subject With No Object cuts through a host of technicalities that have obscured previous discussions of these projects and presents clear concise accounts with minimal prerequisites of a dozen strategies for nominalistic interpretation of mathematics thus equipping the reader to evaluate each and to compare different ones The authors also offer critical discussion rare in the literature of the aims and claims of nominalistic interpretation suggesting that it is significant in a very different way from that usually assumed      University of Michigan Official Publication , 1940      **Mathematical Work in Educational Context** Alain Kuzniak, Elizabeth Montoya-Delgadillo, Philippe R. Richard, 2022-03-31 This book is a friendly and complete introduction to one of the most comprehensive contemporary theories of mathematics teaching and learning By focusing on mathematical work performed by students and teachers during mathematics session the theory of Mathematical Workings Spaces MWS has opened up new perspectives and avenues on mathematics education and mathematical thinking In particular it enables the identification of students knowledge production processes and helps teachers to shape them The first part of the book explores the heart of the theory and aims to further describe and understand epistemological and cognitive aspects of mathematical work The second part develops the different MWS dedicated to observing how this work

depends on the expectations of educational systems how it is formed and taught and how individuals appropriate it In the last part some applications and perspectives are discussed regarding topics of major importance today in mathematics education which relate to technological and digital tools teacher training and modeling activities In line with the spirit of the theory the book was written to reflect the conceptual unity at the heart of the theory of MWS and at the same time to show the freedom and diversity of approaches given space therein Written for researchers and professionals in mathematics education it offers plenty of concrete examples from different educational systems around the world to illustrate the theoretical concepts and show the applicability of the theory to practice and research

**Mathematics Education** Sebastian Rezat,Mathias Hattermann,Andrea Peter-Koop,2013-12-13 The diversity of research domains and theories in the field of mathematics education has been a permanent subject of discussions from the origins of the discipline up to the present On the one hand the diversity is regarded as a resource for rich scientific development on the other hand it gives rise to the often repeated criticism of the discipline s lack of focus and identity As one way of focusing on core issues of the discipline the book seeks to open up a discussion about fundamental ideas in the field of mathematics education that permeate different research domains and perspectives The book addresses transformation as one fundamental idea in mathematics education and examines it from different perspectives Transformations are related to knowledge related

to signs and representations of mathematics related to concepts and ideas and related to instruments for the learning of mathematics The book seeks to answer the following questions What do we know about transformations in the different domains What kinds of transformations are crucial How is transformation in each case conceptualized
