**Abstract** The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and blood pressure (BP) of sedentary, middle-aged men. The subjects were randomly assigned to a control group (CG) and an exercise group (EG). The CG was instructed to maintain their current level of physical activity, while the EG was instructed to engage in a 12-week training program consisting of 30 minutes of moderate-intensity aerobic exercise, 3 times per week. The HR and BP were measured at baseline and at the end of the 12-week training program. The results showed that the EG had a significant decrease in both HR and BP compared to the CG. The HR of the EG decreased from 72.5 ± 5.5 beats per minute (bpm) at baseline to 68.5 ± 5.5 bpm at the end of the 12-week training program. The BP of the EG decreased from 125.5 ± 10.5 mmHg at baseline to 120.5 ± 10.5 mmHg at the end of the 12-week training program. The CG showed no significant change in HR or BP. The results of this study suggest that a 12-week training program can effectively reduce the HR and BP of sedentary, middle-aged men.

1. The first step in the process is to identify the problem or goal. This involves understanding the current situation and what needs to be achieved.

2. Next, you need to gather information. This can be done through research, interviews, or data analysis. The goal is to understand the context and constraints of the problem.

3. Once you have gathered information, you need to define the problem more clearly. This involves identifying the key issues and the specific objectives you want to achieve.

4. The next step is to develop a plan. This involves identifying the steps you need to take to achieve your goals and the resources you will need.

5. After you have a plan, you need to implement it. This involves putting your plan into action and monitoring progress.

6. Finally, you need to evaluate the results. This involves comparing the actual outcomes with the goals you set and identifying any areas for improvement.

The following table shows the results of the regression analysis for the dependent variable "Number of children" (N = 1,000). The independent variables are "Age" and "Gender". The table includes the coefficient estimates, standard errors, t-statistics, and p-values for each variable.

Variable	Coefficient	Standard Error	t-statistic	p-value
Age	0.05	0.01	5.00	0.000
Gender	0.10	0.02	5.00	0.000
Constant	1.50	0.10	15.00	0.000

The regression equation is:  $\text{Number of children} = 0.05 \times \text{Age} + 0.10 \times \text{Gender} + 1.50$ .
