Land Surface Atmosphere Interactions For Climate Modeling:

Land Surface – Atmosphere Interactions for Climate Modeling E.F. Wood,2012-12-06 It is well known that the interactions between land surfaces and the atmosphere and the resulting exchanges in water and energy have a tremendous affect on climate The inadequate representation of land atmosphere interactions is a major weakness in current climate models and is providing the motivation for the HAPEX and ISLSCP experiments as well as the proposed Global Energy and Water Experiment GEWEX and the Earth Observing System EOS mission The inadequate representation reflects the recognition that the well known phys ical relationships which are well described at small scales result in different relationships when represented at the scales used in climate models Understanding this transition in the mathematical relationships with increased space time scales appears to be very difficult and has led to different approaches at one extreme the famous bucket model where the land surface is a simple one layer storage without vegetation the other extreme may be Seller s Simple Biosphere Model Sib where one big leaf covers the climate model grid Given the heterogeneous nature of landforms soils and vegetation within a climate model grid the development of new land surface parameterizations and their verification through large scale experiments is perceived to be a challenging area of research for the hydrology and meteorology communities This book evolved from a workshop held at Princeton University to explore the status of land surface parameterizations within climate models and how observational data can be used to assess these parameterizations and improve models

Climate Change to Land Surface Change S.J. McLaren,D.R. Kniveton,2006-02-24 Our views and understanding of variations in climate geomorphological processes and the interrelationships that exist between climatic changes and land surface changes both now and in the past have developed greatly over the last decade This book aims to encapsulate some of these recent advances and focuses on the integration of research that has been conducted by geomorphologists and climatologists on linking climate and land surface changes This book is divided into two main parts Section A incorporates research that has concentrated on short term variations in climate whilst Section B looks at some of the work on long term climate variability The volume concludes with a summary chapter that brings together the various ideas that have been presented in this work and other recent research in this general field This text will be of interest to upper level students of geomorphology Quaternary studies climatology earth sciences and environmental studies It will also be of use to researchers in these fields

[Land-Atmospheric Research Applications in South and Southeast Asia](#) Krishna Prasad Vadrevu,Toshimasa Ohara,Chris Justice,2018-03-26 This edited volume sheds new light on the impact of rapid Land Use Cover Changes LU CC on greenhouse gases GHG s and aerosol emissions in South and Southeast Asia Several countries in South Southeast Asia have the highest population growth rates in the world which is the main cause for LU CC Conversion of dense forests to agricultural areas and then to residential and urban areas is most commonly observed in South Southeast Asian countries

with a significant release of GHG s and aerosols The book showcases several case studies on the use of remote sensing and geospatial technologies to quantify biomass burning and air pollution impacts aerosol pollution LU CC and impacts on ecosystem services The book also includes articles on regional initiatives in research capacity building and training The authors of this book are international experts in the field and their contributions highlight significant drivers and impacts of air pollution in South Southeast Asia Readers will discover the latest tools and techniques in particular the use of satellite remote sensing and geospatial technologies for quantifying GHG s aerosols and pollution episodes in this region Land Surface-atmosphere Interactions in Regional Modeling Over South America Luis Gustavo Goncalves de Goncalves,2005

Verstraete, 2006-04-11 1 2 Michel M VERSTRAETE and Martin BENISTON 1 Space Applications Institute EC Joint Research Centre Ispra Italy 2 Department of Geography University of Fribourg Switzerland This volume contains the proceedings of the workshop entitled Satellite Remote Sensing and Climate Simulations Synergies and Limitations that took place in Les Diablerets Switzerland September 20 24 1999 This international scientific conference aimed at addressing the current and potential role of satellite remote sensing in climate modeling with a particular focus on land surface processes and atmospheric aerosol characterization Global and regional circulation models incorporate our knowledge of the dynamics of the Earth's atmosphere They are used to predict the evolution of the weather and climate Mathematically this system is represented by a set of partial differential equations whose solution requires initial and boundary conditions Limitations in the accuracy and geographical distribution of these constraints and intrinsic mathematical sensitivity to these conditions do not allow the identification of a unique solution prediction Additional observations on the climate system are thus used to constrain the forecasts of the mathematical model to remain close to the observed state of the system

Weather and Climate Events Jianping Li, Richard Swinbank, Richard Grotjahn, Hans Volkert, 2016-03-24 Based largely on an International Commission on Dynamical Meteorology ICDM workshop this timely volume written by leading researchers in the field covers a range of important research issues related to high impact weather and extreme climate events Dynamical linkages between these extremes and various atmospheric and ocean phenomena are examined including Atlantic Multidecadal North Atlantic and Madden Julian Oscillations Annular Modes tropical cyclones and Asian monsoons This book also examines the predictability of high impact weather and extreme climate events on multiple time scales Highlighting recent research and new advances in the field this book enhances understanding of dynamical and physical processes associated with these events to help managers and policy makers make informed decisions to manage risk and prevent or mitigate disasters It also provides guidance on future research directions in atmospheric science meteorology climate science and weather forecasting for experts and young scientists

Vegetation, Water, Humans and the Climate Pavel Kabat, Martin Claussen, Paul A. Dirmeyer, John H.C. Gash, Lelys Bravo de Guenni, Michel Meybeck, Roger Pielke, Charles J. Vörösmarty, Ronald W.A. Hutjes, Sabine Lütkemeier, 2012-12-06 A state of the art overview of the influence of terrestrial vegetation and soils within the Earth system The text deals especially with interactions between the terrestrial biosphere and the atmosphere via the hydrological cycle and their interlinkage with anthropogenic activities Measurements gathered in integrated field experiments in the Sahel the Amazon North America and South east Asia confirm the importance of these interactions Observations are complemented by modelling studies including regional models that simulate flows and transport in river catchments coupled land cover and regional climate systems and Earth system and global circulation models Water nutrient and sediment fluxes in river basins are also discussed and are shown to be highly impacted and

regulated by humans through land use pollution and river engineering Finally the book discusses environmental vulnerability and methodologies for assessing the risks associated with regional and global climatic and environmental variability and change The results reported in this book are based on the research work of many individual scientists and teams around the world associated with the objectives of the IGBP BAHC and WCRP GEWEX international research programmes

Thermodynamic Foundations of the Earth System Axel Kleidon,2016-03-11

Thermodynamics sets fundamental laws for all physical processes and is central to driving and maintaining planetary dynamics But how do Earth system processes perform work where do they derive energy from and what are the limits This accessible book describes how the laws of thermodynamics apply to Earth system processes from solar radiation to motion geochemical cycling and biotic activity It presents a novel view of the thermodynamic Earth system explaining how it functions and evolves how different forms of disequilibrium are being maintained and how evolutionary trends can be interpreted as thermodynamic trends It also offers an original perspective on human activity formulating this in terms of a thermodynamic Earth system process This book uses simple conceptual models and basic mathematical treatments to illustrate the application of thermodynamics to Earth system processes making it ideal for researchers and graduate students across a range of Earth and environmental science disciplines
