Genetics In Otorhinolaryngology:

Genetics in Otorhinolaryngology Ken Kitamura, Karen P. Steel, 2000 How can genetics be useful to general otorhinolaryngologists and their patients This book summarizes the most recent information on genetic diseases including deafness and head and neck cancer that is relevant to clinical practice particularly with reference to accurate genetic counseling The first part of the volume presents a basic and general review of genetics Up to date information on deafness genes is given and the mouse model for hearing impairment is thoroughly described The application of molecular analysis of head and neck carcinoma has been one of the fundamental breakthroughs in understanding the cell biology of the carcinoma Two chapters are devoted to the discussion of tumor suppressor genes and oncogenes This book is highly recommended since genetics particularly molecular genetics is still an unfamiliar subject to otorhinolaryngologists Yet there is a constant need to be alert to the possibility of diagnosing hereditary disorders and to obtain genetic consultation for a complete evaluation A comprehensive list of references is given for those who wish to find more detailed information **Genetics for**

ENT Specialists Dirk Kunst, Hannie Kremer, 2005 The most prevalent ENT disorders are those that affect hearing Approximately 1 in 1 000 children is born with a severe hearing impairment and in at least half of these cases the cause is inherited In recent years considerable progress has been made in the field of molecular genetic studies on hereditary sensorineural hearing impairment and it has recently become possible to make genetic diagnoses based on molecular tests in an increasing number of otologic disorders This book provides practitioners with a concise overview of advances in this important field of medicine and will facilitate improved management of patients with ENT disorders **Scott-Brown's**

Handbook of Genetic Communicative Disorders Sanford E. Gerber,2001-05-11 Many professionals in the communicative sciences are relative newcomers to the understanding of genetics as it applies to communicative disorders A speech language clinician certainly can diagnose and treat stuttering for example but that clinician may not be fully aware of the role of a genetic counselor for the family of a stutterer An audiologist may be able to assess a hearing impairment but an understanding of the underlying genetics of that impairment would make that person a better audiologist The medical geneticist similarly could have an inadequate appreciation of how our genes may

affect language function All of these professionals need a source that brings together essential ideas from related disciplines This is a book about human communication both normal and disordered and how our communication abilities are affected by our genes Many probably most communicative disorders are of genetic origin even if not exclusively genetic A knowledge of genetics therefore is essential to our understanding of communication of communicative disorders of how such disorders come about and of how to deal with them This is the only book to consider the genetics of communicative disorders from a broad perspective It examines genetics embryology and epidemiology along with study of the hearing speech and language disorders themselves It also introduces review of issues relevant to genetic counseling and ethics It is a unique and comprehensive work whose contributors are the leading experts in their respective disciplines Only book available to consider all communicative disorders Unparalleled scrutiny of the sciences basic to the genetics of communicative disorders Specific attention paid to clinical and ethical issues

Genetic Hearing Impairment Cornelius Wilhelmus Radboud Jozef Cremers,Richard Smith,2002-01-01 A decade of innovative findings in the research of molecular biology of hearing and deafness is reflected in this volume The genetic causes for many types of syndromic and non syndromic deafness are identified and genotypic phenotypic relationships are explored Although the type and degree of deafness caused by mutations in different genes significantly overlap relatively unique age related audiometric profiles are also emerging For example the audioprofile of DFNA1 and DFNA6 14 is a low frequency sensorineural hearing loss with DFNA8 14 it is a mid frequency sensorineural hearing loss and with DFNA2 DFNA5 and DFNA20 26 it is a high frequency progressive hearing loss Recognizing such audioprofiles can facilitate well guided decision making in clinical practice and can direct genetic testing for deafness With an accurate genetic diagnosis prognostic information can be provided to patients and their families In the future gene specific habilitation options may also become available To keep up to date with new clinical standards of diagnosing genetic hearing impairment this book is indispensable reading to otorhinolaryngologists and audiologists **Pediatric Otolaryngology** Charles D.
