**Heat and Mass Transfer Modelling During Drying** Mohammad U.H. Joardder, Washim Akram, Azharul Karim, 2021-09-30 Most conventional dryers use random heating to dry diverse materials without considering their thermal sensitivity and energy requirements for drying Eventually excess energy consumption is necessary to attain a low quality dried product Proper heat and mass transfer modelling prior to designing a drying system for selected food materials can overcome these problems Heat and Mass Transfer Modelling During Drying Empirical to Multiscale Approaches extensively discusses the issue of predicting energy consumption in terms of heat and mass transfer simulation A comprehensive mathematical model can help provide proper insight into the underlying transport phenomena within the materials during drying However drying of porous materials such as food is one of the most complex problems in the engineering field that is also multiscale in nature From the modelling perspective heat and mass transfer phenomena can be predicted using empirical to multiscale modelling However multiscale simulation methods can provide a comprehensive understanding of the physics of drying food materials KEY FEATURES Includes a detailed discussion on material properties that are relevant for

drying phenomena Presents an in depth discussion on the underlying physics of drying using conceptual visual content Provides appropriate formulation of mathematical modelling from empirical to multiscale approaches Offers numerical solution approaches to mathematical models Presents possible challenges of different modelling strategies and potential solutions The objective of this book is to discuss the implementation of different modelling techniques ranging from empirical to multiscale in order to understand heat and mass transfer phenomena that take place during drying of porous materials including foods pharmaceutical products paper leather materials and more *Multibody Dynamics 2019* Andrés

Kecskeméthy, Francisco Geu Flores, 2019-06-28 In this work outstanding recent developments in various disciplines such as structural dynamics multiphysics mechanics computational mathematics control theory biomechanics and computer science are merged together in order to provide academicians and professionals with methods and tools for the virtual prototyping of complex mechanical systems Each chapter of the work represents an important contribution to multibody dynamics a discipline that plays a central role in the modelling analysis simulation and optimization of mechanical systems in a variety of fields and for a wide range of applications Construction Materials Peter Domone, John Illston, 2010-05-21 So far in the twenty first century there have been many developments in our understanding of materials behaviour and in their technology and use This new edition has been expanded to cover recent developments such as the use of glass as a structural material It also now examines the contribution that material selection makes to sustainable construction practice considering the availability of raw materials production recycling and reuse which all contribute to the life cycle assessment of structures As well as being brought up to date with current usage and performance standards each section now also contains an extra chapter on recycling Covers the following materials metals concrete ceramics including bricks and masonry polymers fibre composites bituminous materials timber glass This new edition maintains our familiar and accessible format starting with fundamental principles and continuing with a section on each of the major groups of materials It gives you a clear and comprehensive perspective on the whole range of materials used in modern construction A must have for Civil and Structural engineering students and for students of architecture surveying or construction on courses which require an understanding of materials **Microelectronic Implants for Central and Peripheral Nervous System: Overview of Circuit and**

Ashby, D.R.H. Jones, 2014-06-28 Provides a thorough explanation of the basic properties of materials of how these can be controlled by processing of how materials are formed joined and finished and of the chain of reasoning that leads to a successful choice of material for a particular application The materials covered are grouped into four classes metals ceramics polymers and composites Each class is studied in turn identifying the families of materials in the class the microstructural features the processes or treatments used to obtain a particular structure and their design applications The text is supplemented by practical case studies and example problems with answers and a valuable programmed learning course on phase diagrams Composite Mechanics Andreas Öchsner, 2023-08-03 This book in the advanced structured materials series provides first an introduction to the micromechanics of fiber reinforced laminae which deals with the prediction of the macroscopic mechanical lamina properties based on the mechanical properties of the constituents i.e. fibers and matrix Composite materials especially fiber reinforced composites are gaining increasing importance since they can overcome the limits of many structures based on classical metals Particularly the combination of a matrix with fibers provides far better properties than the constituents alone Despite their importance many engineering degree programs do not treat the mechanical behavior of this class of advanced structured materials in detail at least on the bachelor's degree level Thus some engineers are not able to thoroughly apply and introduce these modern engineering materials in their design process The second part of this book provides a systematic and thorough introduction to the classical laminate theory based on the theory for plane elasticity elements and classical shear rigid plate elements The focus is on unidirectional lamina which can be described based on orthotropic constitutive equations and their composition to layered laminates In addition to the elastic behavior failure is investigated based on the maximum stress maximum strain Tsai Hill and the Tsai Wu criteria The introduced classical laminate theory provides a simplified stress analysis and a subsequent failure analysis without the solution of the system of coupled differential equations for the unknown displacements in the three coordinate directions The book concludes with a short introduction to a calculation program the so called Composite Laminate Analysis Tool CLAT which allows the application of the classical laminate based on a sophisticated Python script **Ultra-High Temperature Thermal Energy Storage, Transfer and Conversion** Alejandro Datas, 2020-09-01 Ultra High Temperature Thermal Energy Storage Transfer and Conversion presents a comprehensive analysis of thermal energy storage systems operating at beyond 800 C Editor Dr Alejandro Datas and his team of expert contributors from a variety of regions summarize the main technological options and the most relevant materials and characterization considerations to enable the reader to make the most effective and efficient decisions This book helps the
