Energy To 2050 Scenario For A Sustainable Future:

Energy to 2050 Maria Rosa Virdis,2003 Analysing the interaction between energy and climate change mitigation issues requires the adoption of a long term perspective looking up to fifty years ahead The future cannot be predicted particularly over longer periods However strategic planning and political decisions demand that we explore options for the future and these are best developed through scenarios conjectures as to what might happen in the future based on our past and present experience of the world and on plausible speculation about how these trends may further evolve This volume looks at different types of scenarios evaluating how they can be used to analyse specific aspects of the interaction between energy and environment over the longer term It examines exploratory scenarios based on different expectations of technical and or policy developments over the next 50 years and normative scenarios based on a set of desirable features or norms that the future world should possess These long term scenarios complement the IEA s World Energy Outlook which presents a mid term business as usual scenario with some variants **Energy to 2050** , Energy to 2050 Maria Rosa Virdis,2003

Energy from the Desert Kosuke Kurokawa,Keiichi Komoto,Peter van der Vleuten,David Faiman,2012-05-04 The world s deserts are sufficiently large that in theory covering a fraction of their landmass with PV systems could generate many times the current primary global energy supply In three parts this study details the background and concept of VLS PV maps out a development path towards the realization of VLS PV systems and provides firm recommendations to achieve long term targets This represents the first study to provide a concrete set of answers to the questions that must be addressed in order to secure and exploit the potential for VLS PV technology and its global benefits *The Future of Energy Use* Phil O'Keefe,Nicola Pearsall,Geoff O'Brien,2010-02-09 Following the success of its predecessor this second edition of *The Future of Energy Use* provides essential analysis of the use of different forms of energy and their environmental and social impacts It examines conventional nuclear and renewable sources and technologies using relevant case studies and providing a vital link between technology and related policy issues The new edition has been comprehensively developed and updated including new text diagrams and tables with entire new sections that reflect the significant changes that have occurred since the first edition New material includes a stronger focus on climate change policy and energy security a discussion of the long run marginal costs of oil coverage of the biofuels debate in both the developed and developing worlds an outline of developments in the built environment including transport issues and the relationship between behaviour and energy use It reviews policy shifts with relation to energy efficiency carbon capture and storage combined heat and power and combined cycle gas turbines There is new coverage of nuclear waste storage and proliferation and new material on microgeneration and biofuels as well as essential new information on carbon markets and the hydrogen economy The result is a unique introduction and guide to all the vital issues within energy for students academics and professionals new to the field

International Seminar On Nuclear War And Planetary Emergencies - 36th Session Richard C Ragaini,2007-07-02

The Erice International Seminars are multidisciplinary seminars attended by over 100 eminent participants from all fields of science. Each year a few scientific issues are selected and experts are invited to present contrasting views during the plenary multidisciplinary sessions of the seminar followed by general debates. These sessions offer a unique opportunity for specialists to enlarge their fields of vision by being confronted with ideas and suggestions from high level scientists in complementary domains of science. Associated workshops allow the experts to further refine and process the ideas evoked during the seminar. This year's topics are all currently of high relevance. For example on energy issues we have focused on the future of global nuclear power. On global monitoring of the planet we have focused on the proliferation of nuclear weapons and the Nuclear Proliferation Treaty. On climatology we have investigated the role of aerosols on global warming and their satellite detection. On pollution the role of plastic contaminants in water was revealed through a series of disquieting reports.

Scenarios and Indicators for Sustainable Development-Towards A Critical Assessment of Achievements and Challenges Joachim H. Spangenberg, 2019-03-14 Globalization and telecoupling are enhancing the complexity of the coupled socio ecological system constituted by the interaction between the global ecosphere and the anthroposphere. As a result the demand for tools to identify transformative innovations, assess future risks and support precautionary decisions for sustainability is growing by the day in business and politics. Scenarios are a means of simplification reducing the real world complexity to a limited number of essential factors to analyze their interactions and support policy formulation with indicators as communication and monitoring tools. In particular in a time of fake news and alternative truths a critical reflection amongst producers and users of scenarios and indicators is overdue. The capability for critical self reflection is what distinguishes science from pseudo science and is a condition of trust. The authors of this book test established measurement and modeling approaches against new challenges, assess the weaknesses of prevailing innovation theories and the political ideological embedment of archetypical scenarios. Highlight deficits in taking the physical basics into account and the need to understand global interaction and the stepwise process of energy transitions point out technical as well as conceptual weaknesses in data collection, harmonization and indicator generation always with a view to solving problems.

Sustainable Development, Energy and the City Voula P. Mega, 2006-03-20 Advancing towards sustainable development will be impossible without the active participation of informed and aware citizens and decision makers. This publication will provide the unspecialised decision makers, citizens, students and policy makers of the future with significant information about a dynamic sector, energy and a space city that are critical for sustainability. Cities and the energy field are now on the verge of dramatic changes. Urban energy systems are capital intensive and have long lives. Immediate change is difficult and innovation is crucial for inefficient patterns to be transformed into more intelligent systems. Strongly entrenched ideas start to vacillate and new investments challenge the inertia of old infrastructures. New concepts, values and technological breakthroughs emerge linked to policy and market initiatives, public expectations and scientific

Long-Term Integration of Renewable Energy Sources into the European Energy System The LTI-Research Group, 2012-12-06 A sustainable European energy system mitigating climate change and solving a number of other key environmental problems will require massive reliance on renewable energy sources combined with a sharp increase in energy productivity. Considering that most of the technologies necessary for such a development are already available today, the most important questions are: How can these technologies be integrated into the European energy system? What are the costs and benefits of such a strategy? What are the major bottlenecks and obstacles to such a development? What measures are necessary to support this development? In the book, a sustainable scenario and a fair market scenario are developed as a means to demonstrate that concepts for a sustainable future European energy supply are feasible.

Paths to Sustainable Energy Artie Ng, Jatin Nathwani, 2010-12-30 The world's reliance on existing sources of energy and their associated detrimental impacts on the environment, whether related to poor air or water quality or scarcity impacts on sensitive ecosystems and forests and land use, have been well documented and articulated over the last three decades. What is needed by the world is a set of credible energy solutions that would lead us to a balance between economic growth and a sustainable environment. This book provides an open platform to establish and share knowledge developed by scholars, scientists, and engineers from all over the world about various viable paths to a future of sustainable energy. It has collected a number of intellectually stimulating articles that address issues ranging from public policy formulation to technological innovations for enhancing the development of sustainable energy systems. It will appeal to stakeholders seeking guidance to pursue the paths to sustainable energy.
