Technical Monograph Tennessee Valley Authority, 1941 **NCI Monographs**, 1986 *Models of Oculomotor Control* George K. Hung, 2001 This monograph is a structured review of models of oculomotor control systems that is geared toward biomedical engineers vision scientists and optometry students It aims to provide the biomedical engineer with a thorough understanding of how various engineering control principles are applied to oculomotor systems and the non engineer with knowledge of how various physiological and clinical concepts can be represented quantitatively and efficiently by control system models Basic control system concepts and oculomotor physiology are first introduced along with a glossary to provide background for the more advanced topics Then these concepts are applied to static linear and nonlinear analysis of various oculomotor systems In addition advanced topics are presented on the application of dynamic linear and nonlinear modeling techniques to the oculomotor system with a particular emphasis on myopia development This book can thus serve as a unique reference for quantitative analysis of oculomotor control and as a foundation for future research on the oculomotor system *Model Predictive Control* Eduardo F. Camacho, Carlos Bordons Alba, 2013-01-10 The second edition of Model Predictive Control provides a thorough introduction to theoretical and practical aspects of the most commonly used MPC strategies It bridges the gap between the powerful but often abstract techniques of control researchers and the more empirical approach of practitioners The book demonstrates that a powerful technique does not always require complex control algorithms Many new exercises and examples have also been added throughout Solutions available for download from the authors website save the tutor time and enable the student to follow results more closely even when the tutor isn t present Unmanned Rotorcraft Systems Guowei Cai, Ben M. Chen, Tong Heng Lee, 2011-06-01 Unmanned Rotorcraft Systems explores the research and development of fully functional miniature UAV unmanned aerial vehicle rotorcraft and provides a complete treatment of the design of autonomous miniature rotorcraft UAVs The unmanned system is an integration of advanced technologies developed in communications computing and control areas and is an excellent testing ground for trialing and implementing modern control techniques Included are detailed expositions of systematic hardware construction software systems integration aerodynamic modeling and automatic flight control system design Emphasis is placed on the cooperative control and flight formation of multiple UAVs vision based ground target tracking and landing on moving platforms Other issues such as the development of GPS less indoor micro aerial vehicles and vision based navigation are also discussed in depth utilizing the vision based system for accomplishing ground target tracking attacking and landing cooperative control and flight formation of multiple unmanned rotorcraft and future research directions on the related areas **Service**

Optimal Operation of Batch Membrane Processes Radoslav Paulen, Miroslav Fikar, 2015-09-24 This study concentrates on a general optimization of a particular class of membrane separation processes those involving batch diafiltration Existing practices are explained and operational improvements based on optimal control theory are suggested The first part of the book introduces the theory of membrane processes optimal control and dynamic optimization Separation problems are defined and mathematical models of batch membrane processes derived The control theory focuses on problems of dynamic optimization from a chemical engineering point of view Analytical and numerical methods that can be exploited to treat problems of optimal control for membrane processes are described The second part of the text builds on this theoretical basis to establish solutions for membrane models of increasing complexity Each chapter starts with a derivation of optimal operation and continues with case studies exemplifying various aspects of the control problems under consideration The authors work their way from the limiting flux model through increasingly generalized models to propose a simple numerical approach to the general case of optimal operation for batch diafiltration processes Researchers interested in the modelling of batch processes or in the potential industrial applications of optimal control theory will find this monograph a valuable source of inspiration instruction and ideas

Neural and Fuzzy Logic Control of Drives and Power Systems Marcian Cirstea, Andrei Dinu, Malcolm McCormick, Jeen Ghee Khor, 2002-07-01 The authors guide readers quickly and concisely through the complex topics of neural networks fuzzy logic mathematical modelling of electrical machines power systems control and VHDL design Unlike the academic monographs that have previously been published on each of these subjects this book combines them and is based round case studies of systems analysis control strategies design simulation and implementation The result is a guide to applied control systems design that will appeal equally to students and professional design engineers The book can also be used as a unique VHDL design aid based on real world power engineering applications Introduces cutting edge control systems to a wide readership of engineers and students The first book on neuro fuzzy control systems to take a practical applications based approach backed up with worked examples and case studies Learn to use VHDL in real world applications

Hydraulic Servo-systems Mohieddine Jelali, Andreas Kroll, 2012-12-06 Hydraulic Servo systems details the basic concepts of many recent developments of nonlinear identification and nonlinear control and their application to hydraulic servo systems developments such as feedback linearisation and fuzzy control It also reviews the principles benefits and limitations associated with standard control design approaches such as linear state feedback control feedforward control and compensation for static nonlinearities because of their continued practical importance Featuring theoretical physically based modelling of hydraulic servo systems experimental modelling system identification control strategies for hydraulic servo systems case studies and experimental results Appendices outline the most important fundamentals of nonlinear differential geometry and fuzzy control The book is very application oriented

and provides the reader with detailed working procedures and hints for implementation routines and software tools

Dynamics and Control of Mechanical Systems in Offshore Engineering Wei He, Shuzhi Sam Ge, Bernard Voon Ee How, Yoo Sang Choo, 2013-10-02 Dynamics and Control of Mechanical Systems in Offshore Engineering is a comprehensive treatment of marine mechanical systems MMS involved in processes of great importance such as oil drilling and mineral recovery Ranging from nonlinear dynamic modeling and stability analysis of flexible riser systems through advanced control design for an installation system with a single rigid payload attached by thrusters to robust adaptive control for mooring systems it is an authoritative reference on the dynamics and control of MMS Readers will gain not only a complete picture of MMS at the system level but also a better understanding of the technical considerations involved and solutions to problems that commonly arise from dealing with them The text provides a complete framework of dynamical analysis and control design for marine mechanical systems new results on the dynamical analysis of riser mooring and installation systems together with a general modeling method for a class of MMS a general method and strategy for realizing the control objectives of marine systems with guaranteed stability the effectiveness of which is illustrated by extensive numerical simulation and approximation based control schemes using neural networks for installation of subsea structures with attached thrusters in the presence of time varying environmental disturbances and parametric uncertainties Most of the results presented are analytical with repeatable design algorithms with proven closed loop stability and performance analysis of the proposed controllers is rigorous and detailed Dynamics and Control of Mechanical Systems in Offshore Engineering is primarily intended for researchers and engineers in the system and control community but graduate students studying control and marine engineering will also find it a useful resource as will practitioners working on the design running or maintenance of offshore platforms

Advances in Applied Nonlinear Optimal Control Gerasimos Rigatos, Electra Karapanou, 2020-11-19 This volume discusses advances in applied nonlinear optimal control comprising both theoretical analysis of the developed control methods and case studies about their use in robotics mechatronics electric power generation power electronics micro electronics biological systems biomedical systems financial systems and industrial production processes The advantages of the nonlinear optimal control approaches which are developed here are that by applying approximate linearization of the controlled systems state space description one can avoid the elaborated state variables transformations diffeomorphisms which are required by global linearization based control methods The book also applies the control input directly to the power unit of the controlled systems and not on an equivalent linearized description thus avoiding the inverse transformations met in global linearization based control methods and the potential appearance of singularity problems The method adopted here also retains the known advantages of optimal control that is the best trade off between accurate tracking of reference setpoints and moderate variations of the control inputs The book's findings on nonlinear optimal control are a substantial contribution to the areas of nonlinear control and complex dynamical systems and

will find use in several research and engineering disciplines and in practical applications

Propulsion Nikolaos Xiros, 2012-12-06 This book covers a number of models and control types An integrated nonlinear state space model of the marine propulsion system is developed This is based upon physical principles that incorporate uncertainties arising from engine thermodynamics and disturbances arising from propeller hydrodynamics The mode employs artificial neural networks to depict the nonlinearities of the thermochemical processes of engine power torque generation and the engine turbocharger dynamical interaction neural nets combine the required mathematical flexibility and formalism with numerical training and calibration options using either thermodynamic engine models or measured data series The neural state space model is decomposed appropriately to provide a linearised perturbation model suitable for controller synthesis The proportional integral derivative control law is examined under the perspective of shaft speed regulation for enhanced disturbance rejection of the propeller load The typical marine shafting system dynamics and configuration allow for a smart implementation of the D term on shaft torque feedback Full state feedback control is examined for increased robustness of the compensated plant against parametric uncertainty and neglected dynamics The H requirements on the closed loop transfer matrix are appropriately decomposed to similar ones on scalar transfer functions which give specifications that are easier to manipulate In effect the methods are comparatively assessed and suggestions and practical applications are given This synthetic approach to propulsion plant control and operational problems should prove useful for both theoreticians and practitioners and can be easily adopted for the control of other processes or systems outside the marine field as well
