Engineering Geology Of Ancient V1:

Recent Research on Engineering Geology and Geological Engineering Janusz Wasowski, Tom Dijkstra, 2018-11-07 The ongoing population growth is resulting in rapid urbanization new infrastructure development and increasing demand for the Earth's natural resources e.g. water, oil, gas, minerals. This together with the current climate change and increasing impact of natural hazards imply that the engineering geology profession is called upon to respond to new challenges. It is recognized that these challenges are particularly relevant in the developing and newly industrialized regions. The idea behind this Volume is to highlight the role of engineering geology and geological engineering in fostering sustainable use of the Earth's resources, smart urbanization and infrastructure protection from geohazards. We selected 19 contributions from across the globe, 16 countries, five continents, which cover a wide spectrum of applied interdisciplinary and multidisciplinary research from geology to engineering. By illustrating a series of practical case studies, the Volume offers a rather unique opportunity to share the experiences of engineering geologists and geological engineers who tackle complex problems working in different environmental and social settings. The specific topics addressed by the papers included in the Volume are the following: pre-design site investigations, physical and mechanical properties of engineering soils, novel affordable sensing technologies for long-term geotechnical monitoring of engineering structures, slope stability assessments and monitoring in active open cast mines, control of environmental impacts and hazards posed by abandoned coal mines, assessment of and protection from geohazards, landslides, ground fracturing, coastal erosion, applications of geophysical surveying to investigate active faults and ground instability, numerical modeling of seabed deformations related to active faulting, deep geological repositories and waste disposal, aquifer assessment based on the integrated hydrogeological and geophysical investigation, use of remote sensing and GIS tools for the detection of environmental hazards and mapping of surface geology. More recently many urban services have been placed underground. Over this time humans have rarely considered how underground space can contribute to or be

engineered to maximize its contribution to the sustainability of society As human activities begin to change the planet and population struggle to maintain satisfactory standards of living placing new infrastructure and related facilities underground may be the most successful way to encourage or support the redirection of urban development into sustainable patterns Well maintained resilient and adequately performing underground infrastructure therefore becomes an essential part of sustainability but much remains to be learned about improving the sustainability of underground infrastructure itself At the request of the National Science Foundation NSF the National Research Council NRC conducted a study to consider sustainable underground development in the urban environment to identify research needed to maximize opportunities for using underground space and to enhance understanding among the public and technical communities of the role of underground engineering in urban sustainability Underground Engineering for Sustainable Urban Development explains the findings of researchers and practitioners with expertise in geotechnical engineering underground design and construction trenchless technologies risk assessment visualization techniques for geotechnical applications sustainable infrastructure development life cycle assessment infrastructure policy and planning and fire prevention safety and ventilation in the underground This report is intended to inform a future research track and will be of interest to a broad audience including those in the private and public sectors engaged in urban and facility planning and design underground construction and safety and security
