**Linguistic Aspects in Machine Translation** Alexander Täuschel, 2008-10-24 Project Report from the year 2006 in the subject English Language and Literature Studies Other grade 1 3 University of Frankfurt Main Institut für England und Amerikastudien course Translation and Intercultural Communication language English abstract This paper will give a general overview of the venture that is machine translation with particular focus on linguistic aspects It will display history of MT and will deal with some of the major issues in the realisation of MT like the difficulty of translating prepositions or integrating semantics as well as the importance of real world knowledge To illustrate these difficulties with examples on a basic level a practice test with a moderately complex translation engine provided by Google has been carried out and will be explained Finally I am going to introduce three of the largest and most powerful translation machines currently in use I will also give a brief overview of methods of MT The aim of this paper is to show that the realisation of the primal idea of machine translation in its original sense which was to perform translation without human intervention except during the construction phase of the system is still markedly far away at present and machines are still unlikely to take over the jobs of human translators *Language and Machines* ALPAC (Organization), 1966 *An Introduction to Machine Translation* William John Hutchins, H. L. Somers, 1992 The translation of foreign language texts by computers was one of the first tasks that the pioneers of computing and artificial intelligence set themselves Machine translation is again becoming an important field of research and development as the need for translations of technical and commercial documentation is growing beyond the capacity of the translation profession **Machine Translation and Translation Theory** Christa Hauenschild, Susanne Heizmann, 2011-08-02 The series serves to propagate investigations into language usage especially with respect to computational support This includes all forms of text handling activity not only interlingual translations but also conversions carried out in response to different communicative tasks Among the major topics are problems of text transfer and the interplay between human and machine activities **Machine Translation** John Lehrberger, 1988 The use of the computer in translating natural languages ranges from that of a translator's aid for word processing and dictionary lookup to that of a full fledged translator on its own However the obstacles to translating by means of the computer are primarily linguistic To overcome them it is necessary to resolve the ambiguities that pervade a natural language when words and sentences are viewed in isolation The problem then is to formalize in the computer these aspects of natural language understanding The authors show how from a linguistic point of view one may form some idea of what goes on inside a system's black box given only the input original text and the raw output translated text before post editing Many examples of English French translation are used to illustrate the principles involved **Translation, Brains and the Computer** Bernard Scott, 2018-06-06 This book is about machine translation MT and the classic problems associated with this language technology It examines the causes of these problems and for linguistic rule based systems attributes the cause to language

ambiguity and complexity and their interplay in logic driven processes For non linguistic data driven systems the book attributes translation shortcomings to the very lack of linguistics It then proposes a demonstrable way to relieve these drawbacks in the shape of a working translation model Logos Model that has taken its inspiration from key assumptions about psycholinguistic and neurolinguistic function The book suggests that this brain based mechanism is effective precisely because it bridges both linguistically driven and data driven methodologies It shows how simulation of this cerebral mechanism has freed this one MT model from the all important classic problem of complexity when coping with the ambiguities of language Logos Model accomplishes this by a data driven process that does not sacrifice linguistic knowledge but that like the brain integrates linguistics within a data driven process As a consequence the book suggests that the brain like mechanism embedded in this model has the potential to contribute to further advances in machine translation in all its technological instantiations

Translation Engines: Techniques for Machine Translation Arturo Trujillo, 1999-10-08 Machine translation MT is the area of computer science and applied linguistics dealing with the translation of human languages such as English and German MT on the Internet has become an important tool by providing fast economical and useful translations With globalisation and expanding trade demand for translation is set to grow Translation Engines covers theoretical and practical aspects of MT both classic and new including Character sets and formatting languages Translation memory Linguistic and computational foundations Basic computational linguistic techniques Transfer and interlingua MT Evaluation Software accompanies the text providing readers with hands on experience of the main algorithms

**Sign Language Machine Translation** Andy Way, Lorraine Leeson, Dimitar Shterionov, 2024-11-11 This book for the first time collects important current topics in the area of sign language translation in a single volume The topic is introduced more generally to benefit newcomers to the field before diving into the current state of the art methods of Sign Language Machine Translation SLMT together with an in depth description of issues specific to this topic including an introduction to and historical overview of SLMT ethical issues related to the engagement of and with deaf users the importance of data the sign languages of Europe sign language recognition and synthesis including via avatars data driven and linguistically informed models of SLMT gloss translation fingerspelling SLMT communication and SLMT in practice Of interest to MT developers and users as well as people working in deaf studies this volume presents cutting edge research on machine translation in the field of deaf studies

Linguistically Motivated Statistical Machine Translation Deyi Xiong, Min Zhang, 2015-02-11 This book provides a wide variety of algorithms and models to integrate linguistic knowledge into Statistical Machine Translation SMT It helps advance conventional SMT to linguistically motivated SMT by enhancing the following three essential components translation reordering and bracketing models It also serves the purpose of promoting the in depth study of the impacts of linguistic knowledge on machine translation Finally it provides a systematic introduction of Bracketing Transduction Grammar BTG based SMT one of the state of the art SMT formalisms as well as a case study of linguistically motivated SMT

on a BTG based platform      **Hybrid Approaches to Machine Translation** Marta R. Costa-jussà, Reinhard Rapp, Patrik Lambert, Kurt Eberle, Rafael E. Banchs, Bogdan Babych, 2016-07-12 This volume provides an overview of the field of Hybrid Machine Translation MT and presents some of the latest research conducted by linguists and practitioners from different multidisciplinary areas Nowadays most important developments in MT are achieved by combining data driven and rule based techniques These combinations typically involve hybridization of different traditional paradigms such as the introduction of linguistic knowledge into statistical approaches to MT the incorporation of data driven components into rule based approaches or statistical and rule based pre and post processing for both types of MT architectures The book is of interest primarily to MT specialists but also in the wider fields of Computational Linguistics Machine Learning and Data Mining to translators and managers of translation companies and departments who are interested in recent developments concerning automated translation tools      Recent Advances in Example-Based Machine Translation M. Carl, Andy Way, 2003-06-30 Recent Advances in Example Based Machine Translation is of relevance to researchers and program developers in the field of Machine Translation and especially Example Based Machine Translation bilingual text processing and cross linguistic information retrieval It is also of interest to translation technologists and localisation professionals Recent Advances in Example Based Machine Translation fills a void because it is the first book to tackle the issue of EBMT in depth It gives a state of the art overview of EBMT techniques and provides a coherent structure in which all aspects of EBMT are embedded Its contributions are written by long standing researchers in the field of MT in general and EBMT in particular This book can be used in graduate level courses in machine translation and statistical NLP      Linguistic Issues in Machine Translation Frank Van Eynde, 2015-12-17 The key assumption in this text is that machine translation is not merely a mechanical process but in fact requires a high level of linguistic sophistication as the nuances of syntax semantics and intonation cannot always be conveyed by modern technology The increasing dependence on artificial communication by private and corporate users makes this research area an invaluable element when teaching linguistic theory      **Machine Translation** William John Hutchins, 1986      *Machine translation for everyone: Empowering users in the age of artificial intelligence* Dorothy Kenny , 2022-07-06 Language learning and translation have always been complementary pillars of multilingualism in the European Union Both have been affected by the increasing availability of machine translation MT language learners now make use of free online MT to help them both understand and produce texts in a second language but there are fears that uninformed use of the technology could undermine effective language learning At the same time MT is promoted as a technology that will change the face of professional translation but the technical opacity of contemporary approaches and the legal and ethical issues they raise can make the participation of human translators in contemporary MT workflows particularly complicated Against this background this book attempts to promote teaching and learning about MT among a broad range of readers including language learners language teachers trainee translators translation teachers and professional translators It

presents a rationale for learning about MT and provides both a basic introduction to contemporary machine learning based MT and a more advanced discussion of neural MT It explores the ethical issues that increased use of MT raises and provides advice on its application in language learning It also shows how users can make the most of MT through pre editing post editing and customization of the technology **Computers and Translation** Harold Somers, 2003-05-28 This volume is about computers and translation It is not however a Computer Science book nor does it have much to say about Translation Theory Rather it is a book for translators and other professional linguists technical writers bilingual secretaries language teachers even which aims at clarifying explaining and exemplifying the impact that computers have had and are having on their profession It is about Machine Translation MT but it is also about Computer Aided or Assisted Translation CAT computer based resources for translators the past present and future of translation and the computer The editor and main contributor Harold Somers is Professor of Language Engineering at UMIST Manchester With over 25 years experience in the field both as a researcher and educator Somers is editor of one of the field's premier journals and has written extensively on the subject including the field's most widely quoted textbook on MT now out of print and somewhat out of date The current volume aims to provide an accessible yet not overwhelmingly technical book aimed primarily at translators and other users of CAT software

**The Possibility of Language** Alan K. Melby, Terry Warner, 1995-12-08 This book is about the limits of machine translation It is widely recognized that machine translation systems do much better on domain specific controlled language texts domain texts for short than on dynamic general language texts general texts for short The authors explore this general domain distinction and come to some uncommon conclusions about the nature of language Domain language is claimed to be made possible by general language while general language is claimed to be made possible by the ethical dimensions of relationships Domain language is unharmed by the constraints of objectivism while general language is suffocated by those constraints Along the way to these conclusions visits are made to Descartes and Saussure to Chomsky and Lakoff to Wittgenstein and Levinas From these conclusions consequences are drawn for machine translation and translator tools for linguistic theory and translation theory The title of the book does not question whether language is possible it asks with wonder and awe why communication through language is possible

**Readings in Machine Translation** Sergei Nirenburg, H. L. Somers, Yorick Wilks, 2003 The field of machine translation MT the automation of translation between human languages has existed for more than 50 years MT helped to usher in the field of computational linguistics and has influenced methods and applications in knowledge representation information theory and mathematical statistics

**Machine Translation and the Lexicon** Petra Steffens, 1995-03-06 This volume constitutes the proceedings of the Third International Workshop of the European Association for Machine Translation held in Heidelberg Germany in April 1993 The EAMT Workshops traditionally aim at bringing together researchers developers users and others interested in the field of machine or computer assisted translation research development and use The volume presents thoroughly revised

versions of the 15 best workshop contributions together with an introductory survey by the volume editor The presentations are centered primarily on questions of acquiring sharing and managing lexical data but also address aspects of lexical description

*Handbook of Natural Language Processing and Machine Translation* Joseph Olive, Caitlin Christianson, John McCary, 2011-03-02 This comprehensive handbook written by leading experts in the field details the groundbreaking research conducted under the breakthrough GALE program The Global Autonomous Language Exploitation within the Defense Advanced Research Projects Agency DARPA while placing it in the context of previous research in the fields of natural language and signal processing artificial intelligence and machine translation The most fundamental contrast between GALE and its predecessor programs was its holistic integration of previously separate or sequential processes In earlier language research programs each of the individual processes was performed separately and sequentially speech recognition language recognition transcription translation and content summarization The GALE program employed a distinctly new approach by executing these processes simultaneously Speech and language recognition algorithms now aid translation and transcription processes and vice versa This combination of previously distinct processes has produced significant research and performance breakthroughs and has fundamentally changed the natural language processing and machine translation fields This comprehensive handbook provides an exhaustive exploration into these latest technologies in natural language speech and signal processing and machine translation providing researchers practitioners and students with an authoritative reference on the topic

**Computers in Translation** John Newton, 2002-09-11 Researchers have been attempting to develop systems that would emulate the human translation process for some forty years What is it about human language that makes this such a daunting challenge While other software packages have achieved rapid and lasting success machine translation has failed to penetrate the worldwide market to any appreciable extent Does this merely reflect a reluctance to adopt it or does it signal a more fundamental and intractable problem Computers in Translation is a comprehensive guide to the practical issues surrounding machine translation and computer based translation tools Translators system designers system operators and researchers present the facts about machine translation its history its successes its limitations and its potential Three chapters deal with actual machine translation applications discussing installations including the METEO system used in Canada to translate weather forecasts and weather reports and the system used in the Foreign Technology Division of the US Air Force
