**Linked** Albert-László Barabási, 2002 We've long suspected that we live in a small world where everything is connected to everything else Indeed networks are pervasive from the human brain to the Internet to the economy to our group of friends These linkages it turns out aren't random All networks to the great surprise of scientists have an underlying order and follow simple laws Understanding the structure and behavior of these networks will help us do some amazing things from designing the optimal organization of a firm to stopping a disease outbreak before it spreads catastrophically In *Linked* Barabási a physicist whose work has revolutionized the study of networks traces the development of this rapidly unfolding science and introduces us to the scientists carrying out this pioneering work These new cartographers are mapping networks in a wide range of scientific disciplines proving that social networks corporations and cells are more similar than they are different and providing important new insights into the interconnected world around us This knowledge says Barabási can shed light on the robustness of the Internet the spread of fads and viruses even the future of democracy

*The New Science of Cities* Michael Batty, 2017-07-28 A proposal for a new way to understand cities and their design not as artifacts but as systems composed of flows and networks In *The New Science of Cities* Michael Batty suggests that to understand cities we must view them not simply as places in space but as systems of networks and flows To understand space he argues we must understand flows and to understand flows we must understand networks the relations between objects that compose the system of the city Drawing on the complexity sciences social physics urban economics transportation theory regional science and urban geography and building on his own previous work Batty introduces theories and methods that reveal the deep structure of how cities function Batty presents the foundations of a new science of cities defining flows and their networks and introducing tools that can be applied to understanding different aspects of city structure He examines the size of cities their internal order the transport routes that define them and the locations that fix these networks He introduces methods of simulation that range from simple stochastic models to bottom up evolutionary models to aggregate land use transportation models Then using largely the same tools he presents design and decision making models that predict interactions and flows in future cities These networks emphasize a notion with relevance for future research and planning that design of cities is collective action
