Forest Science Elias Costa de Souza, Subramanian Senthilkannan Muthu, 2023-07-24 This book highlights the sustainability aspects of products and processes in forest science. The forest products sector supplies raw materials to several industrial sectors worldwide. These products can be classified as timber or non timber products. Wood products are those that originate from the woody fraction and can include pulp, charcoal, firewood and others. The non timber products on the other hand have the products extracted from the different parts of the tree such as bark, leaves, fruits, resins, oils, tannins or even products extracted from non woody biomass such as palm heart or carnauba among others. There are new studies and new products developed from forests worldwide each day. However, studies that evaluate the sustainability of these products and the processes related to their production are not so common. It is essential to highlight the sustainability aspects of these activities and the products obtained from them such that steps can be taken to make the processes eco friendly. Allied to ecological sustainability studies that evaluate the technical and economic feasibility of such activities arise. With this book the authors through the approach of other products and processes of forest science present the practical vision of aligning production with sustainability in an economically viable way. The book analyses different products and processes ranging from technological production of engineered wood products to handcrafted resins with a high commercial appeal. With the expertise of different authors who are researchers in various specific areas of forest sciences this book helps expand research and presents new insights assisting industry decision makers and researchers working in the areas forest sciences.

The Ecology of Tropical East Asia Richard T. Corlett, 2019-06-27 Tropical East Asia is home to over one billion people and faces massive human impacts from its rising population and rapid economic growth It has already lost more than half of its forest cover to agriculture and urbanization and has the highest rates of deforestation and logging in the tropics Habitat loss coupled with hunting and the relentless trade in wildlife products threatens all its large and many of its smaller vertebrates Despite these problems the region still supports an estimated 15 25% of global terrestrial biodiversity and a growing environmental awareness means that it is no longer assumed that economic development justifies environmental damage and no longer accepted that this trade off is inevitable Effective conservation action now depends on integrating a clear understanding of the ecological patterns and processes in the region with the varied needs of its human population This third edition continues

to provide an overview of the terrestrial ecology of Tropical East Asia from southern China to Indonesia and from Bhutan and Bangladesh to the Ryukyu Islands of Japan. It retains the balance between compactness and comprehensiveness of the previous editions and the even handed geographical treatment of the whole region but it updates both the contents and the perspective. Approximately one third of the text is new or greatly modified reflecting the explosion of new research in the region in the last few years and the increasing use of new tools particularly from genomics and remote sensing. The change in perspective largely reflects the growing realization that we are in a new epoch the Anthropocene in which human activities have at least as large an influence as natural processes and that stopping or reversing ecological change is no longer an option. This does not mean that biodiversity conservation is no longer possible or worthwhile but that the biodiverse future we strive for will inevitably be very different from the past. The Ecology of Tropical East Asia is an advanced textbook suitable for senior undergraduate and graduate level students taking courses on the terrestrial ecology of the East Asian tropics as well as an authoritative regional reference for professional ecologists, conservationists and interested amateurs worldwide.

Modeling of a logistics network for wood flows from by-products and cascade utilization Mohammad Sadegh Taskhiri, 2016-05-27. Waste Wood and wood by products have the potential to become attractive alternative sources of raw materials. Their efficient use is important due to the rising demand and limited supply of forest wood. Cascade utilization is gaining interest as a strategy to bridge the gap between rising wood demand and fresh wood availability. However the economic and environmental impacts of a cascading system for wood based products are not fully known. In this work an investigation is conducted to determine the consequences of cascade utilization for the economic and environmental performance of logistics networks for wood flows. Two case studies in Lower Saxony consider five wood products including medium density fiber, MDF, oriented strand board, OSB, particleboard, coated paper and wood pellets. In the first case study an approach for decision support is developed that consists of a mixed integer linear programming (MILP) model. In the first case study the MILP model is used for minimizing the costs of the logistics network for three scenarios. Then the UMBERTO software is applied to determine the quantity of CO₂e of the minimized logistics network. In the second case study the MILP model is enhanced using two objective functions as cost and global warming potential (GWP) are considered simultaneously. In this case study it is observed that environmental parameters such as CO₂ emissions can also be implemented in the MILP. The utilization of a multi objective optimization model brings new perspectives the trade off between two contradictory objective functions for instance in comparison to the first case study in which CO₂ is calculated as an off line step after logistics costs are minimized. Altholz und Holz Nebenprodukte besitzen das Potenzial attraktive alternative Rohstoffquellen zu werden. Ihre effiziente Nutzung ist von hoher Relevanz, da die Nachfrage nach Holz steigt und die Versorgung mit Holz aus Wäldern begrenzt ist. Um die Lücke zwischen der wachsenden Holznachfrage und Verfügbarkeit zu überbrücken ist die Kaskadennutzung eine Strategie, welche zunehmendes Interesse erfährt. Allerdings sind die wirtschaftlichen und ökologischen

Auswirkungen eines Kaskadensystems für Holzprodukte nicht vollständig bekannt In dieser Arbeit wird eine Untersuchung durchgeführt um die Folgen der Kaskadennutzung auf die Wirtschafts und Umweltleistung von Logistiknetzwerken für Holzströme zu bestimmen Im Rahmen von zwei Fallstudien in Niedersachsen werden fünf Holzprodukte einschließlich mitteldichten Fasern MDF OSB Platten OSB Spanplatten beschichtetem Papier und Holz Pellets betrachtet In der ersten Fallstudie wird ein Ansatz zur Entscheidungsunterstützung entwickelt der aus einem Mixed Integer Linear Programming MILP Modell besteht Das MILP Modell wird zuerst in drei verschiedenen Szenarien zur Minimierung der Logistikkosten angewendet Mithilfe der UMBERTO Software wird anschließend die Menge von CO₂e bestimmt In der zweiten Fallstudie wird das Modell für zwei Zielfunktionen weiterentwickelt und eingesetzt bei denen die Kosten und das Treibhausgaspotenzial gleichzeitig betrachtet werden Diese Fallstudie zeigt dass auch Umweltparameter wie CO₂ Emissionen mit MILP umgesetzt werden können Die Verwendung eines Mehrzieloptimierungsmodells ermöglicht die Betrachtung neuer Perspektiven zum Beispiel den Trade off zwischen zwei widersprüchlichen Zielfunktionen im Vergleich zur ersten Fallstudie in welcher CO₂ Emissionen in einem Offline Schritt nach der Minimierung der Logistikkosten minimiert werden
