The attractive physical and mechanical properties of ordered intermetallic alloys have been recognized since early in this century. However, periodic attempts to develop intermetallics for structural applications were unsuccessful due in major part to the twin handicaps of inadequate low temperature ductility or toughness together with poor elevated temperature creep strength. The discovery in 1979 by Aoki and Izumi in Japan that small additions of boron caused a dramatic improvement in the ductility of Ni<sub>3</sub>Al was a major factor in launching a new wave of fundamental and applied research on intermetallics. Another important factor was the issuance in 1984 of a National Materials Advisory Board report entitled *Structural Uses for Ductile Ordered Alloys* which identified numerous potential defense related applications and proposed the launching of a coordinated development program to gather engineering property and processing data. A substantial research effort on titanium aluminides was already underway at the Air Force Materials Laboratory at Wright Patterson Air Force Base in Ohio and with Air Force support at several industrial and university laboratories. Smaller programs also were under way at Oak Ridge National Laboratory under Department of Energy sponsorship. These research efforts were soon augmented in the United States by funding from Department of Defense agencies such as Office of Naval Research and Air Force Office of Scientific Research and by the National Science Foundation.

**Industrial Technology Assessments** National Research Council, Division on Engineering and Physical Sciences, National Materials Advisory Board, Commission on Engineering and Technical Systems, Committee on Industrial Technology Assessments, 1999-09-18

In 1993 the U.S. Department of Energy DOE Office of Industrial Technology OIT established a group of seven industries designated as Industries of the Future IOF. These industries were selected for their high energy use and large waste generation. The original IOF included the aluminum, chemicals, forest products, glass, metalcasting, petroleum refining, and steel industries. Each industry was asked to provide a future vision and a road map detailing the research required to realize its vision. In November 1994 the forest products industry was the first of the IOF industries to enter into an agreement with DOE OIT. DOE OIT asked the National Research Council's National Materials Advisory Board NMAB to provide guidance for OIT's transition to the new IOF strategy. The Committee on Industrial Technology Assessment CITA was formed for this purpose with the specific tasks of reviewing and evaluating the overall OIT program, reviewing selected OIT sponsored research projects, and identifying crosscutting technologies, i.e. technologies applicable to more than one industry. CITA was asked to focus on three specific areas: intermetallic alloys, manufacturing process controls, and separations. A separate panel was formed to study each area and publish the results in separate reports.
