

If the fresh produce is consumed raw, the source of water should be identified, and the related risk should be assessed in view of determining the level of control measures.

- Potentially high or unknown risk if for example untreated wastewater, surface water or shallow groundwater.
- Potentially medium risk if for example collected rainwater.
- Potentially low risk if treated (waste) water, potable water or deep groundwater.

The matrix in Table 1 is an example that can be used as a simple approach to the potential level of risk posed by the use or reuse of various water sources during pre-harvest stages of fresh produce and their intended use.

Table 1.¹⁷ Example to estimate the potential level of risk posed by the use or reuse of various water sources during pre-harvest stages of fresh produce according to their intended use

Intended use of fresh produce	Contact of the water with edible portion?	Water source				
		Wastewater	Surface and groundwater of unknown quality	Groundwater collected from protected wells	Hygienically collected rainwater	Potable water, deep groundwater, or other water, including treated reused water, which complies with the microbiological criteria applicable to potable water
Ready-to-eat	YES	High risk	High risk	Medium risk	Medium risk	Low risk
	NO	High risk	High risk	Low risk	Low risk	Low risk
Cooked	YES	Low risk*	Low risk*	Low risk	Low risk	Low risk
	NO	Low risk*	Low risk*	Low risk	Low risk	Low risk

* Instead of low-risk ranking in the JEMRA Report, No. 33, medium-risk ranking may be considered because the microbial reduction of cooking procedures can be highly variable, depending on the type of produce, the cooking time and temperature applied and the level of contamination of the water. Contact of water with the edible part may also enhance the risk.

When data (e.g. on microbial quality of the water sources, and on relevant health data from exposed populations) and resources allow the conduct of a quantitative or semi-quantitative risk assessment can be considered. This may allow risk mitigation measures to be more cost-effective and tailored to the specific needs.

8. RISK MITIGATION/RISK MANAGEMENT STRATEGIES

8.1 Indicator organism for monitoring hazards in water used in fresh produce production

Indicator organisms should be used as indicators of faecal contamination rather than presence or concentration level of any specific pathogen. The major indicator organisms are *E. coli* and enterococci.

Such faecal indicators can be used as process indicators or to validate the efficacy of water treatments, if they respond to treatment processes in a similar manner to pathogens of concern.

It should be taken into account that, in general, faecal indicators maximally predict the probable presence of faecal pathogens in water, but they cannot precisely predict the concentrations present, with the possible exception of heavily polluted waters. The correlation becomes erratic and biologically improbable as dilution occurs.

Bacteriophages are better indicators of enteric viruses than bacterial faecal indicators, although they cannot be absolutely relied upon as indicators for enteric viruses. A combination of two or more bacteriophages can be considered. Bacteriophages can be used as good process indicators to determine the efficacy of water treatments against enteric viruses.

Protozoa and helminth cysts/eggs survive more easily than bacteria and viruses and there is no suitable indicator of their presence/absence in irrigation water. Specific tests should be performed if the presence of these parasites is suspected.

Indicators of Viruses in Water and Food Gerald Berg,1978 Indicators of Viruses in Water and Food ,1978

Viruses in Foods Sagar Goyal,2007-01-15 Cases of viral foodborne outbreaks are on the rise in part due to the increases in population scarcity of clean water and changes in eating habits Outbreaks attributed to toxic fungal parasitic and bacterial agents are very well known and characterized because we have known about these diseases for a long time and have developed appropriate methods to investigate and track them Detection methods to investigate and track viral agents in food with the exception of shellfish have only recently begun to be developed However with the advent of molecular diagnostic methods the role of viruses in foodborne disease outbreaks is beginning to be understood Viruses in Foods is the first book that comprehensively discusses the role of viruses in foodborne disease outbreaks along with strategies for the prevention and control of viral contamination of food *Viruses and Wastewater Treatment* M. Goddard,M. Butler,2015-12-04 Viruses and Wastewater Treatment covers the proceedings of the International Symposium on Viruses and Wastewater Treatment The book presents studies that deal primarily with the virological aspect of water sanitation The topics covered in the selection include methods for studying virus in waste waters such as virus recovery from wastewater using microfiberglass filters and rapid detection of enteroviruses in water by a quantitative fluorescent antibody technique The text also covers topics about post treatment of waste waters which includes fate of viruses following land application of sewage sludge and virus survival in wastewater treated soils The book will be of great use to individuals involved in the research development and implementation of water treatment technology *Third Nordic Workshop on Viruses in Food and Water* Mette

Viruses in Foods Sagar M. Goyal,Jennifer L. Cannon,2016-08-25 Foodborne viruses are an important group of pathogens recognized to cause significant disease globally in terms of both number of illnesses and severity of disease Contamination of foods by enteric viruses such as human norovirus and hepatitis A and E viruses is a major concern to public health and food safety Food Virology is a burgeoning field of emphasis for scientific research Many developments in foodborne virus

detection prevention and control have been made in recent years and are the basis of this publication This second edition of *Viruses in Foods* provides an up to date description of foodborne viruses of public health importance including their epidemiology and methods for detection prevention and control It uniquely includes case reports of past outbreaks with implications for better control of future outbreaks a section that can be considered a handbook for foodborne virus detection and updated and expanded information on virus prevention and control with chapters on natural virucidal compounds in foods and risk assessment of foodborne viruses
