Transactions Volume 125 **Fundamental Issues in Control of Carbon Gasification Reactivity** L Lahaye, Pierre Ehrburger, 2012-12-06 During the last decade there has been a renewed interest in understanding from a fundamental point of view the gasification of carbon. Basically there are two major issues in controlling the reactivity of carbon: i) reduction of the gasification rate of carbon materials in hostile environment; ii) increase of the gasification rate in order to utilize carbonaceous compounds more effectively. Although these two objectives look somewhat contradictory, they are part of the general topics of understanding gasification reactivity of carbon. Refractory applications of carbon in furnace linings, seals and vanes, as well as the use of carbon-carbon or carbon-ceramic composites in structures able to withstand corrosion at high temperature, require a better understanding of the fundamentals involved in carbon-oxidizing gas (O_2 , CO , H_2O) reactions. Furthermore, a great interest of aluminium producers is extending the lifetime of carbon electrodes in alumina electrolysis, which primarily depends on reducing their consumption rates by air or carbon dioxide. Proper control of gasification reactions is also of prime importance in manufacturing carbonaceous adsorbents like granular activated carbon, clothes of high adsorption characteristics. The balance between increase of porosity and decrease in mechanical strength during activation is critical for developing new porous types of carbon materials, in particular for carbon clothes, and this can only be achieved by a careful control of the gasification reaction. Smelter Grade Alumina from Bauxite Benny E. Raahauge, Fred S. Williams, 2022-01-23 This book provides a comprehensive review of the production of smelter grade alumina from bauxite ores. It emphasizes the best practices applied in the industry today but seen in a historical context with a view to future challenges and developments. The control of alumina quality is discussed in detail, including the effects that alumina quality has on the aluminum smelter process with respect to environmental performance, current efficiency and metal purity. The discussion of alumina quality will be relevant to people on the smelter side as this is the interface between refinery and smelter. Emphasis is placed on the major steps of the Bayer Process, including digestion, clarification, precipitation, calcination and management of water, energy and bauxite residue. This book is a valuable resource for active, seasoned practitioners and for new engineers entering the industry. Minerals Yearbook United States.
