Multivariate Statistical Modelling Based on Generalized Linear Models Ludwig Fahrmeir, Gerhard Tutz, 2013-11-11 Classical statistical models for regression time series and longitudinal data provide well established tools for approximately normally distributed variables Enhanced by the availability of software packages these models dominated the field of applications for a long time With the introduction of generalized linear models GLM a much more flexible instrument for statistical modelling has been created The broad class of GLMs includes some of the classical linear models as special cases but is particularly suited for categorical discrete or nonnegative responses The last decade has seen various extensions of GLMs multivariate and multicategorical models have been considered longitudinal data analysis has been developed in this setting random effects and nonparametric predictors have been included These extended methods have grown around generalized linear models but often are no longer GLMs in the original sense The aim of this book is to bring together and review a large part of these recent advances in statistical modelling Although the continuous case is sketched sometimes throughout the book the focus is on categorical data The book deals with regression analysis in a wider sense including not only cross sectional analysis but also time series and longitudinal data situations We do not consider problems of symmetrical nature like the investigation of the association structure in a given set of variables For example log linear models for contingency tables which can be treated as special cases of GLMs are totally omitted The estimation approach that is primarily considered in this book is likelihood based

Regression, ANOVA, and the General Linear Model Peter Vik, 2013-01-14 Peter Vik's *Regression ANOVA and the General Linear Model* A Statistics Primer demonstrates basic statistical concepts from two different perspectives giving the reader a conceptual understanding of how to interpret statistics and their use. The two perspectives are 1 a traditional focus on the t test, correlation, and ANOVA and 2 a model comparison approach using General Linear Models (GLM). This book juxtaposes the two approaches by presenting a traditional approach in one chapter followed by the same analysis demonstrated using GLM. By so doing, students will acquire a theoretical and conceptual appreciation for data analysis as well as an applied practical understanding as to how these two approaches are alike. **Linear Models** Shayle R.
