

$$A_0(\mathbf{x}) = \mathbb{E}[\mathbf{g}^T(\mathbf{x})\mathbf{g}(\mathbf{x})|\mathbf{g}(\mathbf{x}) = \mathbf{q}(\mathbf{x})], \quad \mathbf{g} = \mathbf{0} \text{ or } \mathbf{1}.$$

$$(14-52)$$

We proceed to the calculation of $A_0(\mathbf{x})$ later. From (14-52) we find that

$$\begin{aligned} \ln \left[\frac{\Pr\{\mathbf{g}(\mathbf{x}) = \mathbf{1}\}}{\Pr\{\mathbf{g}(\mathbf{x}) = \mathbf{0}\}} \right] &= \frac{1}{2} \ln \left[\frac{A_0(\mathbf{x})}{A_1(\mathbf{x})} \right] \\ &+ \frac{1}{2} \mathbf{x}^T \mathbf{B} \mathbf{x} \left[\frac{1}{A_0(\mathbf{x})} - \frac{1}{A_1(\mathbf{x})} \right] \end{aligned} \quad (14-53)$$

in which A_0 and A_1 are those for $A_{\mathbf{g}(\mathbf{x})=0}$ and $A_{\mathbf{g}(\mathbf{x})=1}$, respectively. Additionally, because of the symmetry nature of $\mathbf{q}(\mathbf{x})$,

$$\ln \left[\frac{\Pr\{\mathbf{g}(\mathbf{x}) = \mathbf{1}\}}{\Pr\{\mathbf{g}(\mathbf{x}) = \mathbf{0}\}} \right] = \ln \left[\frac{A}{1-A} \right] \quad (14-54)$$

Substituting (14-52) and (14-53) into (14-54), we find that the latter can be expressed as

$$\ln A(\mathbf{x}) = \frac{1}{2} \mathbf{x}^T \mathbf{B} \mathbf{x} \left[\frac{1}{A_0(\mathbf{x})} - \frac{1}{A_1(\mathbf{x})} \right] + \frac{1}{2} \ln \left[\frac{A_0(\mathbf{x})}{A_1(\mathbf{x})} \right] = \ln \left[\frac{A}{1-A} \right] \quad (14-55)$$

Substituting (14-55) into the left-hand side of (14-52), our MMAP detection rule can be expressed as

$$\begin{aligned} \text{if } \mathbf{r}^T \mathbf{C} \mathbf{r} &\geq \left[\frac{A_0(\mathbf{C} \mathbf{r} \mathbf{C} \mathbf{r} + 1)}{A_0(\mathbf{C} \mathbf{r} \mathbf{C} \mathbf{r}) + A_1(\mathbf{C} \mathbf{r} \mathbf{C} \mathbf{r})} \right] \left[\ln \left[\frac{A_0(\mathbf{x})}{A_1(\mathbf{x})} \right] - \mathbf{x}^T \mathbf{B} \mathbf{x} \left[\frac{1}{1-A} \right] \right] & \text{decide } \mathbf{g}(\mathbf{x}) = \mathbf{1} \\ \text{if } \mathbf{r}^T \mathbf{C} \mathbf{r} &\leq \left[\frac{A_0(\mathbf{C} \mathbf{r} \mathbf{C} \mathbf{r} + 1)}{A_0(\mathbf{C} \mathbf{r} \mathbf{C} \mathbf{r}) + A_1(\mathbf{C} \mathbf{r} \mathbf{C} \mathbf{r})} \right] \left[\ln \left[\frac{A_0(\mathbf{x})}{A_1(\mathbf{x})} \right] - \mathbf{x}^T \mathbf{B} \mathbf{x} \left[\frac{1}{1-A} \right] \right] & \text{decide } \mathbf{g}(\mathbf{x}) = \mathbf{0} \end{aligned} \quad (14-56)$$

From (14-52) and (14-54) and making use of the facts that $\mathbf{r}(\mathbf{x})$ and $\mathbf{w}(\mathbf{x})$ are statistically independent and $\mathbf{r}(\mathbf{x})$ and $\mathbf{w}(\mathbf{x})$ do not depend on $\mathbf{q}(\mathbf{x})$, in fact, then

$$\begin{aligned} A_0(\mathbf{x}) &= \mathbb{E}[\mathbf{r}^T \mathbf{C} \mathbf{r} | \mathbf{g}(\mathbf{x}) = \mathbf{0}] = \mathbf{r}^T \mathbf{C} \mathbf{r} \mathbb{E}[\mathbf{w}^T \mathbf{B} \mathbf{w} | \mathbf{g}(\mathbf{x}) = \mathbf{0}] + \mathbb{E}[\mathbf{r}^T \mathbf{B} \mathbf{r}] \\ &= \mathbf{r}^T \mathbf{C} \mathbf{r} \mathbb{E}[\mathbf{w}^T \mathbf{B} \mathbf{w}] + \mathbf{r}^T \mathbf{B} \mathbf{r} \end{aligned} \quad (14-57)$$

Observe, therefore, that $A_0(\mathbf{x}) = \sigma_r^2$ and $A_1(\mathbf{x}) = \sigma_r^2 + \mathbf{r}^T \mathbf{B} \mathbf{r}$ [47]. Use these two values in (14-56) to perform the test.

Because (14-56) involves squaring up the measurements, it is often referred to as a square-law detector. For an illustration of how mathematics can be used to obtain the quantities needed on the right-hand side of (14-56), see Problems 14-15. \square

Model-Based Signal Processing James V. Candy, 2005-10-27 A unique treatment of signal processing using a model based perspective Signal processing is primarily aimed at extracting useful information while

rejecting the extraneous from noisy data. If signal levels are high then basic techniques can be applied. However low signal levels require using the underlying physics to correct the problem causing these low levels and extracting the desired information. Model based signal processing incorporates the physical phenomena measurements and noise in the form of mathematical models to solve this problem. Not only does the approach enable signal processors to work directly in terms of the problem's physics instrumentation and uncertainties but it provides far superior performance over the standard techniques. Model based signal processing is both a modeler's as well as a signal processor's tool. Model Based Signal Processing develops the model based approach in a unified manner and follows it through the text in the algorithms examples applications and case studies. The approach coupled with the hierarchy of physics based models that the author develops including linear as well as nonlinear representations makes it a unique contribution to the field of signal processing. The text includes parametric e.g. autoregressive or all pole sinusoidal wave based and state space models as some of the model sets with its focus on how they may be used to solve signal processing problems. Special features are provided that assist readers in understanding the material and learning how to apply their new knowledge to solving real life problems. Unified treatment of well known signal processing models including physics based model sets. Simple applications demonstrate how the model based approach works while detailed case studies demonstrate problem solutions in their entirety from concept to model development through simulation application to real data and detailed performance analysis. Summaries provided with each chapter ensure that readers understand the key points needed to move forward in the text as well as MATLAB® Notes that describe the key commands and toolboxes readily available to perform the algorithms discussed. References lead to more in depth coverage of specialized topics. Problem sets test readers knowledge and help them put their new skills into practice. The author demonstrates how the basic idea of model based signal processing is a highly effective and natural way to solve both basic as well as complex processing problems. Designed as a graduate level text this book is also essential reading for practicing signal processing professionals and scientists who will find the variety of case studies to be invaluable. An Instructor's Manual presenting detailed solutions to all the problems in the book is available from the Wiley editorial department.

Maximum-Likelihood Deconvolution Jerry M. Mendel, 2012-12-06 Convolution is the most important operation that describes the behavior of a linear time invariant dynamical system Deconvolution is the unraveling of convolution It is the inverse problem of generating the system's input from knowledge about the system's output and dynamics Deconvolution requires a careful balancing of bandwidth and signal to noise ratio effects Maximum likelihood deconvolution MLD is a design procedure that handles both effects It draws upon ideas from Maximum Likelihood when unknown parameters are random It leads to linear and nonlinear signal processors that provide high resolution estimates of a system's input All aspects of MLD are described from first principles in this book The purpose of this volume is to explain MLD as simply as possible To do this the entire theory of MLD is presented in terms of a convolutional signal generating model and some relatively simple ideas from optimization theory Earlier approaches to MLD which are couched in the language of state variable models and estimation theory are unnecessary to understand the essence of MLD MLD is a model based signal processing procedure because it is based on a signal model namely the convolutional model The book focuses on three aspects of MLD 1 specification of a probability model for the system's measured output 2 determination of an appropriate likelihood function and 3 maximization of that likelihood function Many practical algorithms are obtained Computational aspects of MLD are described in great detail Extensive simulations are provided including real data applications
