Hybrid Simulation Models Of Production Networks:

Hybrid Simulation Models of Production Networks Vassilis S. Kouikoglou, Yannis A. Phillis, 2001-07-31 This book is concerned with a most important area of industrial production that of analysis and optimization of production lines and networks using discrete event models and simulation The book introduces a novel approach that combines analytic models and discrete event simulation Unlike conventional piece by piece simulation this method observes a reduced number of events between which the evolution of the system is tracked analytically Using this hybrid approach several models are developed for the analysis of production lines and networks The hybrid approach combines speed and accuracy for exceptional analysis of most practical situations A number of optimization problems involving buffer design workforce planning and production control are solved through the use of hybrid models

Hybrid Simulation Models of Production Networks Vassilis Kouikoglou, Yannis Phillis, 2013-08-21 Industrial production is one of the most basic human activities indispensable to the economic activity Due to its complexity production is not very well understood and modeled as opposed to traditional fields of inquiry such as physics This book aims at enhancing rigorous understanding of a particular area of production that of analysis and optimization of production lines and networks using discrete event models and simulation To our knowledge this is the first book treating this subject from the point of view mentioned above We have arrived at the realization that discrete event models and simulation provide perhaps the best tools to model production lines and networks for a number of reasons Analysis is precise but demands enormous computational resources usually unavailable in practical situations Brute force simulation is also precise but slow when quick decisions are to be made Approximate analytical models are fast but often unreliable as far as accuracy is concerned The approach of the book on the other hand combines speed and accuracy to an exceptional degree in most practical applications

Production Planning with Capacitated Resources and Congestion Hubert Missbauer, Reha Uzsoy, 2020-02-26 This book presents a comprehensive overview of recent

developments in production planning The monograph begins with an introductory chapter reviewing the need for these production planning models that operate by determining time phased releases of work into the facility or supply chain relating these to the Manufacturing Planning and Control MPC and Advanced Planning and Scheduling APS frameworks that form the basis of most academic research and industrial practice The extensive body of work on Workload Control is also placed in this context and proves the need for improved models with a discussion of the difficulties these approaches encounter The next two chapters present a detailed review of the state of the art in optimization models based on exogenous planned lead times and examines the cases where these can take both integer and fractional values The difficulties arising in estimating planned lead times are consistent with factory behavior which are highlighted noting that many of these lead to non convex optimization models Attempts to address these difficulties by iterative multimodel approaches that combine simulation and mathematical programming are also discussed in detail The next three chapters of the volume address the set of techniques developed using clearing functions which represent the expected output of a resource in a planning period as a function of the expected workload of the resource during that period The chapters on this subject propose a basic optimization model for multiple products discuss the difficulties of this model and some possible solutions It also reviews prior work and discuss a number of alternative formulations of the clearing function concept with their respective advantages and disadvantages Applications to lot sizing decisions and a number of other specific problems are also described This volume concludes with an assessment of the state of the art described in the volume and several directions for future work

Robust Manufacturing Control Katja Windt, 2012-12-14 This contributed volume collects research papers presented at the CIRP Sponsored Conference Robust Manufacturing Control Innovative and Interdisciplinary Approaches for Global Networks RoMaC 2012 Jacobs University Bremen Germany June 18th 20th 2012 These research papers present the latest developments and new ideas focusing on robust manufacturing control for global networks Today Global Production Networks i e the nexus of interconnected material and information flows through which products and services are manufactured assembled and distributed are confronted with and expected to adapt to sudden and unpredictable large scale changes of important parameters which are occurring more and more frequently event propagation in networks with high degree of interconnectivity which leads to unforeseen fluctuations and non equilibrium states which increasingly characterize daily business These multi scale changes deeply influence logistic target achievement and call for robust planning and control strategies Therefore understanding the cause and effects of multi scale changes in production networks is of major interest New methodological approaches from different science disciplines are promising to contribute to a new level comprehension of network processes Unconventional methods from biology perturbation ecology or auditory display are gaining increasing importance as they are confronted with similar challenges Advancements from the classical disciplines such as mathematics physics and engineering are also becoming of continuing importance Energy-Related Material Flow

Simulation in Production and Logistics Sigrid Wenzel, Markus Rabe, Steffen Strassburger, Christoph von Viebahn, 2023-12-14

This book provides for the first time an overview on the current approaches and applications of energy aspects in production and logistics by the use of simulation techniques During the last decade the importance of energy in the material flow processes has become more and more important The pressure to reduce the environmental footprint of production and logistics systems will even intensify in future Therefore enterprises have started to integrate the use of energy into their planning processes much more than before even designing feedback loops e g from energy control to production control This receives additional attention with the increasing use of renewable but less reliable energy sources Care must be taken to establish processes that aim to use energy when it is available As an example many industrial processes like melting or coating have significant energy demands but could vary the point of time of its consumption within specific limits leading to a very high complexity It discusses the construction and application of energy specific performance indicators and analyzes the input information that needs to be acquired before implementing suitable models On this basis concrete technical solutions are introduced
