**Procedure** Hydraulic Brake Components Standards Committee, 2012 The SAE Recommended Practice specifies the test procedure to assure valve assemblies which are satisfactory for vehicle usage and it is applicable to new valve assemblies for commercial production It covers such valves where they are employed in passenger car and light truck brake systems utilizing motor vehicle hydraulic brake fluids This procedure and requirements SAE J1137 was developed for brake fluids conforming to SAE J1703 and FMVSS 116 DOT 3 however it may be utilized for valves which use DOT 4 or DOT 5 brake fluid These procedure specifications were developed for base brake operation and do not consider the effects of ABS anti lock brake systems or traction control systems which may have a significant effect on the valve Careful analysis of the particular

type ABS and or traction control if included in the system should be made and additional tests are required which are not included in this document Provisions for ABS and traction control will be incorporated in a future revision or covered in a separate document The minimum performance requirements are specified in SAE J1137 The use of hydraulic valves had decreased with the advent of electronic controls so this standard should be stabilized *Hydraulic and Air/hydraulic Brakes Preventive Maintenance* ,1993 *Hydraulic Valves for Motor Vehicle Brake Systems--Performance Requirements* Hydraulic Brake Components Standards Committee,2002 This SAE Recommended Practice applies to valve assemblies that are used on passenger car and light truck braking systems utilizing motor vehicle hydraulic brake fluids The procedure SAE J1118 and these requirements SAE J1137 were developed for brake fluids conforming to SAE J1703 and FMVSS 116 DOT 3 requirements however it may be utilized for valves which use DOT 4 or DOT 5 brake fluid These requirements are applicable to differential warning metering hold off bypass function or proportioning type valves or any combination thereof Brake Design and Safety Rudolf Limpert,2011-10-04 The objectives of this third edition of an SAE classic title are to provide readers with the basic theoretical fundamentals and analytical tools necessary to design braking systems for passenger vehicles and trucks that comply with safety standards minimize consumer complaints and perform safely and efficiently before and while electronic brake controls become active This book written for students engineers forensic experts and brake technicians provides readers with theoretical knowledge of braking physics and offers numerous illustrations and equations that make the information easy to understand and apply New to this edition are expanded chapters on Thermal analysis of automotive brakes Analysis of hydraulic brake systems Single vehicle braking dynamics *Brake Systems* Mike Mavrigian,Larry W. Carley,1998 Brakes are one of the most frequently repaired maintenance items on vehicles and a critical component to racing success Whether you re an auto enthusiast brake repair professional or avid racer a thorough understanding of how brakes function and operate is important Hydraulic Brake Systems ,1981 **Long Life Hydraulic Brake System Summary Report** R. Ziskind,1979 **Vehicle-in-use System Safety Analysis. Volume III: Safety Analysis of Braking System. Final Report** ,1970 **A New Self-Contained Electro-Hydraulic Brake System** Laaleh Durali,2015 The automotive brake system plays a significant role not only in the deceleration and stopping process but also in many stability control strategies To overcome the limitations of conventional brake systems and to improve vehicle control strategies such as traction control and differential braking a new generation of brake systems called the brake by wire system has been introduced to the vehicle industry This generation of brake systems combines electrical mechanical and in some cases hydraulic components Although different types of brake by wire mechanisms have been developed in the past two decades there still exist demands for further improvement and developing new brake mechanisms in the automotive industry due to the ever increasing demand for better safety and performance This research proposes a novel brake by wire system based on cam actuation This system is a combination of electrical mechanical and hydraulic components The unique feature of the cam

actuation brake system proposed in this research is that the characteristics of the motor torque amplification can be optimized by careful design of the cam shape The compactness and self contained characteristic of the design allow the brake system to be installed on each wheel enabling fully independent control of each wheel for better stability control Moreover the cam actuated brake has a fail safe advantage by keeping the direct connection between the driver and the brake calipers in case of any system failure In this work different subsystems of the brake system and their components are explained the dynamic model of the system is found and the design parameters are optimized Specifically the optimal design problem has been formulated by taking the geometry of the cam as the optimization variable and the open loop response time of the brake system as the objective function to be minimized The solution to this problem is then obtained by the multi layer design optimization process using the genetic algorithm GA Various control algorithms are applied to the developed cam actuated brake system to investigate their performance in terms of tracking a desired braking pressure **Diesel**
