Advancement in Hydrological Modeling and Water Resources Management for achieving Sustainable Development Goals (SDGs) Vikram Kumar,Jahangeer Jahangeer,Rajneesh Singh,Prabhat Kumar Singh Dikshit,2025-04-24

Availability of water for domestic and agricultural activities have become crucial due to rapid urbanization growing population and climate change It is essential to develop effective strategies for managing water resources sustainably These stressors complicate water resources management and pose a major bottleneck in achieving many United Nations Sustainable Development Goals SDGs The affected SDGs that relate to these issues are 1 SDG2 zero hunger 2 SDG6 clean water and sanitation and 3 SDG 13 climate action To achieve these SDGs recent advancement in hydrological modelling and water resources management offer promising solutions including access to safe and affordable drinking water sanitation and the protection and restoration of freshwater ecosystems Thus the collective goal of this Research Topic is to showcase the latest research and developments in the field of hydrological modelling as well as water resources monitoring and management It will provide specific focus to how these advances can contribute to the achievement of the UN SDGs related to water resources In particular the individual goals of this Research Topic are to contribute knowledge towards 1 Integrated water resource management 2 Climate change adaptation 3 Water quality management 4 Data driven decision making through hydrological modelling 5 Advancement in technologies tools for water resource management 6 Engaging stakeholders to promote a holistic approach to water resources management

Yucca Mountain Site Characterization Project Bibliography, 1994-1995 ,1996 Distributed Hydrological Modelling Michael B. Abbott,Jens Christian Refsgaard,2012-12-06 It is the task of the engineer as of any other professional person to do everything that is reasonably possible to analyse the difficulties with which his or her client is confronted and on this basis to design solutions and implement these in practice The distributed hydrological model is correspondingly the means for doing everything that is reasonably possible of mobilising as much data and testing it with as much knowledge as is economically feasible for the purpose of analysing problems and of designing and implementing remedial measures in the case of difficulties arising within the hydrological cycle Thus the aim of distributed hydrologic modelling is to make the fullest use of cartographic data of geological data of satellite data of stream discharge measurements of borehole data of observations of crops and other vegetation of historical records of floods and droughts and indeed of everything else that has ever been recorded or remembered and then to apply to this everything that is known about meteorology plant physiology soil physics hydrogeology sediment transport and everything else that is relevant within this context Of course no matter how much data we have and no matter how much we know it will never be enough to treat some problems and some situations but still we can aim in this way to do the best that we possibly can

Understanding Water in a Dry Environment Ian Simmers, 2003-01-01 In order to provide water security in the twenty first century there is universal agreement that a continuation of current policies and extrapolation of trends is not an option Also clear is that from both water supply and development perspectives the world's arid and semi arid regions are those currently and potentially experiencing the highest water stresses One third of the world's land surface is classified as arid or semi arid and about half of all countries are directly affected in some way by problems of aridity The hydrology of arid and semi arid areas is also known to be substantially different from that in more humid regions It is therefore essential that investigation methods appropriate to the former are developed and applied and that strategies for arid and semi arid region water resources development recognise the principal characteristics of in situ hydrological processes

Research Basins and Hydrological Planning R.Z. Xi, Wei-Zu Gu, Klaus-Peter Seiler, 2004-10-14 In the 20th century water management focused on the local scale of interest In the 21st century we will be facing changes in the quantity of our water cycle The forces behind these new challenges are industrialisation population growth and an insufficiently swift response to climatic change The magnitude and distribution of global changes are not exactly predictable because we live in an ever changing environment and are faced with extreme and interacting processes which all are not yet sufficiently understood Therefore to shoulder this task hydrology should embrace more integrative and interdisciplinary approaches and achieve more flexibility in assessments and decisions To better confront this challenge catchment related solutions are more important than local solutions to satisfy the water demand of agriculture ecosystems industry and the private sector It is wise to keep in mind that the environment has a sustainable memory and our knowledge about attenuation capacities and resilience of the environment is still low
