Steven Hale's ingenious experiments on the movement of water in plants in 1726 and Hartig's observations of sieve tube exudation in the mid 19th century set the stage for continued intensive studies on long range transport in plants. In spite of this interest for more than 200 years in the movement of solutes and water in plants it has only been within the last 20 to 30 years that extensive research effort has been directed toward a critical evaluation of the interactions among the various cellular organelles. The important roles played by the exchange of metabolites in the control and regulation of cellular processes is now widely recognized but in most instances poorly understood **ERDA Energy Research Abstracts** , 1977
