Mountain Environment A. A. Pirazizy, 1993 Forest Hydrology Mingteh Chang, 2006-05-25 Although a few texts on forest hydrology are available they cover very little if any background on water resources On the other hand books dealing with water resources do not cover topics on forest water relations The one exception to this is Forest Hydrology An Introduction to Water and Forests Now with the publication of a revised edition this volume adds information from recent studies to go even further in providing an introduction to forest hydrology that brings water resources and forest water relations into a single practical and comprehensive volume Focusing on processes and general principles the first six chapters provide an introduction and basic background in water and water resources while the last seven chapters look at the impact of forests on water Between these two groupings is a chapter that serves as an entry to the study of forest impacts on water resources describing forests and forest characteristics important to water circulation sediment movement and stream habitat This second edition also features new information on forests and flooding forest and stream habitat snow vaporization processes and GIS methods in hydrology research examples on evaporation estimates and a new appendix on forest interception measurements Employing examples and case studies the book provides tools to help natural resource managers play an active role in policymaking and land use planning and in developing partnerships with stakeholders It also offers unique perspectives for addressing urban sprawl

Slope Stability and Erosion Control: Ecotechnological Solutions Joanne E. Norris, Alexia Stokes, Slobodan B. Mickovski, Erik Cammeraat, Rens van Beek, Bruce C. Nicoll, Alexis Achim, 2008-02-29 This chapter describes the processes involved in the transport of material over hillslopes Hillslopes provide the gradients enabling material to be transported from the slopes themselves towards the valley bottoms directly by gravity alone or by water flowing down over the surface Gravity has the potential to transfer material downslope if the material resistance to contact it is insufficient Similarly water and wind flowing along the surface exert a drag on soil particles and have the potential to entrain material After the gradient has fallen below a critical threshold to keep the material in transport deposition occurs Conventionally slope processes in which gravity alone is the dominant transporting agent are called mass movements Brunsden 1984 Processes in which other agents dominate are called erosion e g wind or water erosion Flowing water is an important transporting agent on which the emphasis is placed here Although mass wasting is a natural process its incidence and impact may be exacerbated by human activities Crozier 1986 Morgan 2005 A situation may ultimately arise in which human interests become unsafe or unsustainable This impact is not only directly felt in the areas where material is removed or deposited and indirectly mass wasting may have an effect on soil and water quality in areas located further downstream In the following sections a brief overview is given of the mechanisms morphology causes and consequences of mass movements and erosion

Sand Dunes of the Northern Hemisphere Qi Lu, Mahesh K. Gaur, Victor R. Squires, 2023-03-10 This book in two volumes and with a foreword by the renowned Professor M A J Williams draws on evidence from coastal and inland regions including desert dunes wind blown dust river and lake sediments glacial moraines plant and animal fossils isotope geochemistry soils and prehistoric archaeology to better understand the genesis and development of dunes systems in selected northern hemisphere sand dunes from Asia Africa and the Middle East regions The collection of research papers and case studies that are presented in this book provide the reader with a wealth of information about the distribution and types of sand dunes and an insight into the

complexity of sand dune formation migration and management Research in many countries across the northern hemisphere shows that dunes whether coastal or inland are under pressure around the world Much of the pressure comes from human activities and the anthropogenic disturbance when coupled with global warming and alterations to the amount frequency and temporal distribution of precipitation could lead to more serious management challenges in the future There is much that we still need to find out about the origin genesis and development of sand dunes so that they can be managed better The difficult and complex questions being repeatedly raised can be answered only by interdisciplinary endeavours Geomorphologists geologists palaeontologists climatologists ecologists and others can work together on research projects that better define the origin evolution and development of dunes both inland and along the coasts Many chapters in this book attempt to reconstruct past climatic changes in deserts and their margins at a variety of scales in space and time in the expectation that such information might assist in preparing us for future global warming and drying
